

TROLL RESEARCH STATION

Midterm presentation 13/3

Group 1: Iris Claus, Daphne Kamsteeg, Ludovica Perone Pacifico, Chloé Phan, Marieke van Wijk

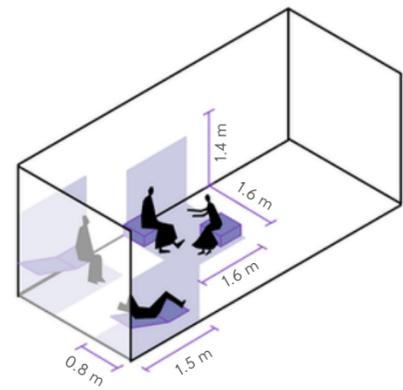

IAP Workshop

Q3 2026

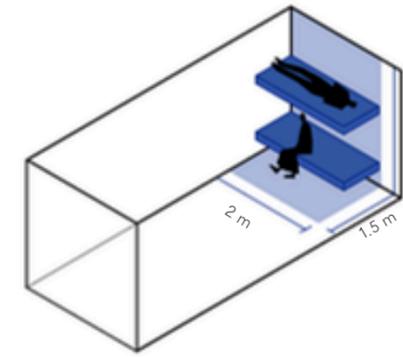

Prof. Henriette Bier, Arwin Hidding, Lisa-Marie Mueller, Vera Laszlo

01

RESEARCH | ACTIVITY MAPPING

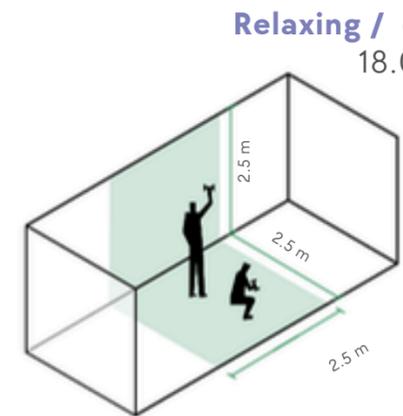

Relaxing
21.00 - 22.00

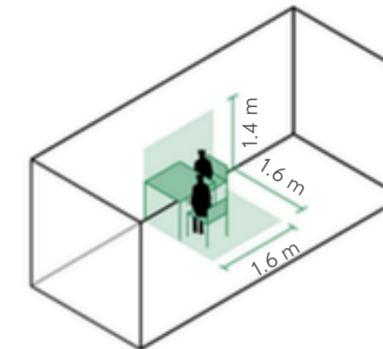

Sleeping
22.00 - 7.00

Highest duration. Lowest frequency, hence must **be folded away or reconfigured**. At **extremities** to minimise daytime circulation interference.

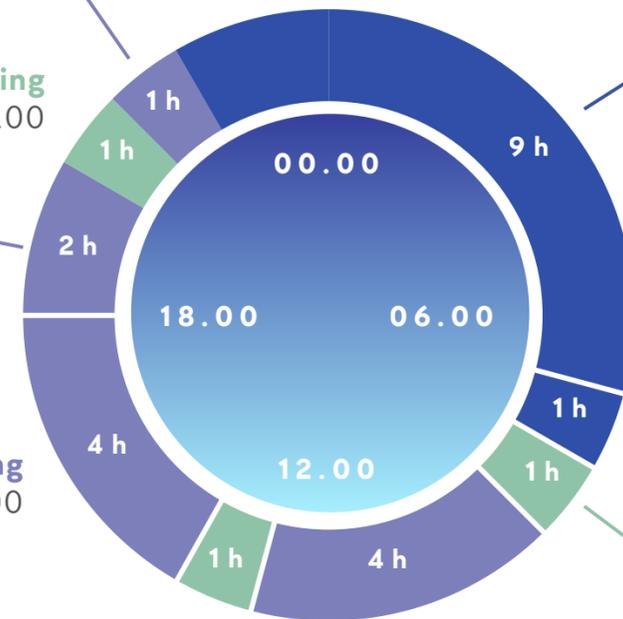

Relaxing / exercising
18.00 - 20.00

Demands **maximum clearance** of floor area.

Hygiene
7.00 - 8.00

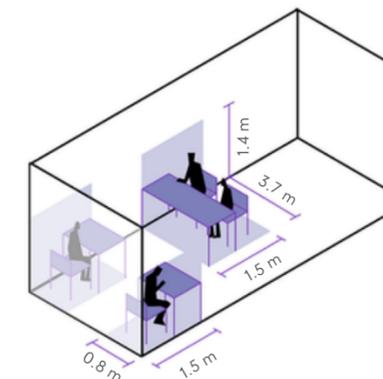

Dining
8.00 - 9.00
Highest frequency, hence must be **easily accessible**.

Working
14.00 - 18.00

Dining
13.00 - 14.00

+ Storage space
of personal items, clothing, working equipment.
Fixed. **Compact**, to maximise space clearance
at least two modules

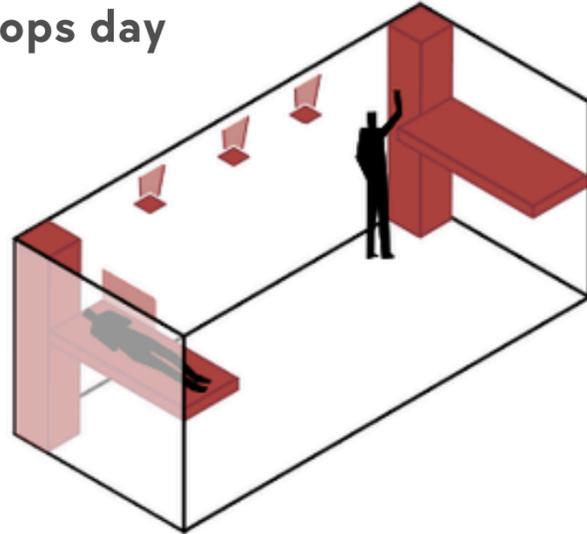

Working
9.00 - 13.00

Legend

- Individual** peripheral zones
- Collective** central zones
- Both** demand two configurations, one for collective and one for private fruition

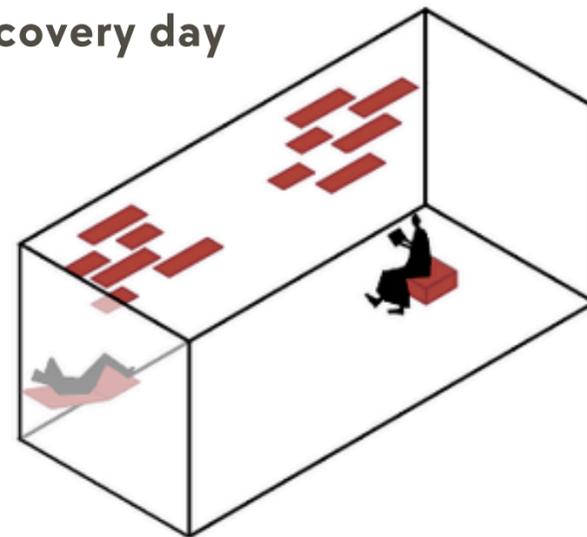

O2 ACTIVITY MAPPING | SCENARIO ANALYSIS

1 - Standard ops day

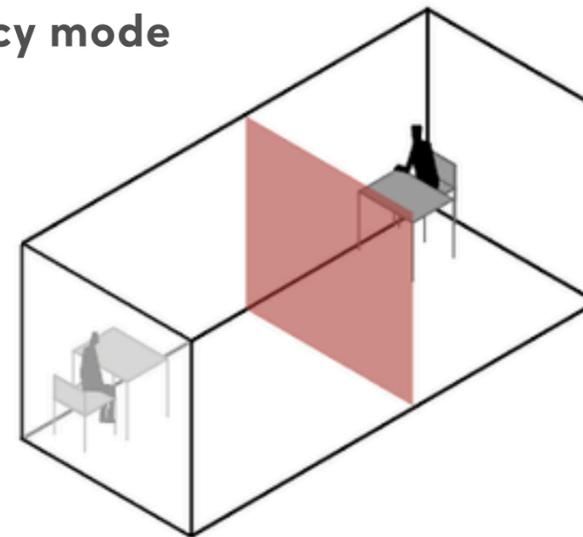

Separate beds with integrated personal storage and privacy separator. For optimized circulation with no functional overlap and light and acoustic shielding in sleeping zone.

2 - Active recovery day

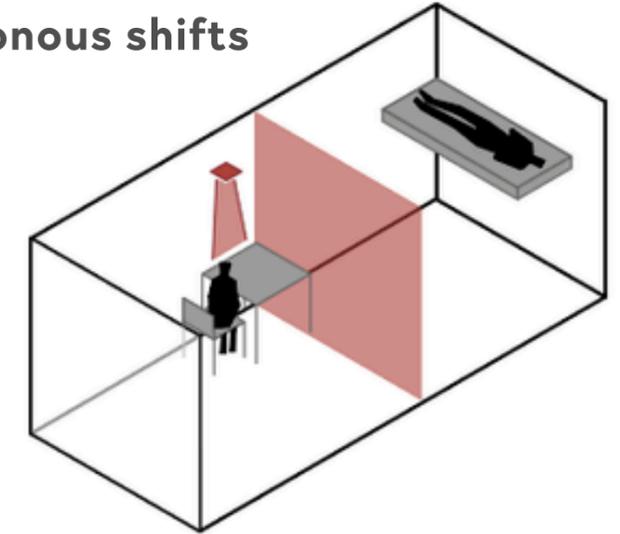

Adjustable modules for user-driven spatial reconfiguration to enable environmental personalization and reduce visual monotony.

3 - Emergency mode

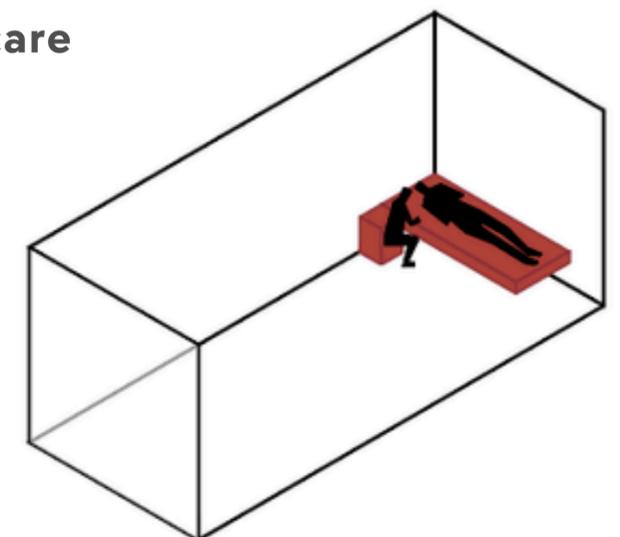

Foldable partition to subdivide container into two private rooms. For increased privacy and psychological benefits during prolonged isolation

4 - Asynchronous shifts

Foldable partition to subdivide container into two private rooms.. Independent light control between the two zones. For increase acoustic and light insulation.

5 - Patient care

Bed at ergonomic standing height and integrated bedside surface to enable assisted care.

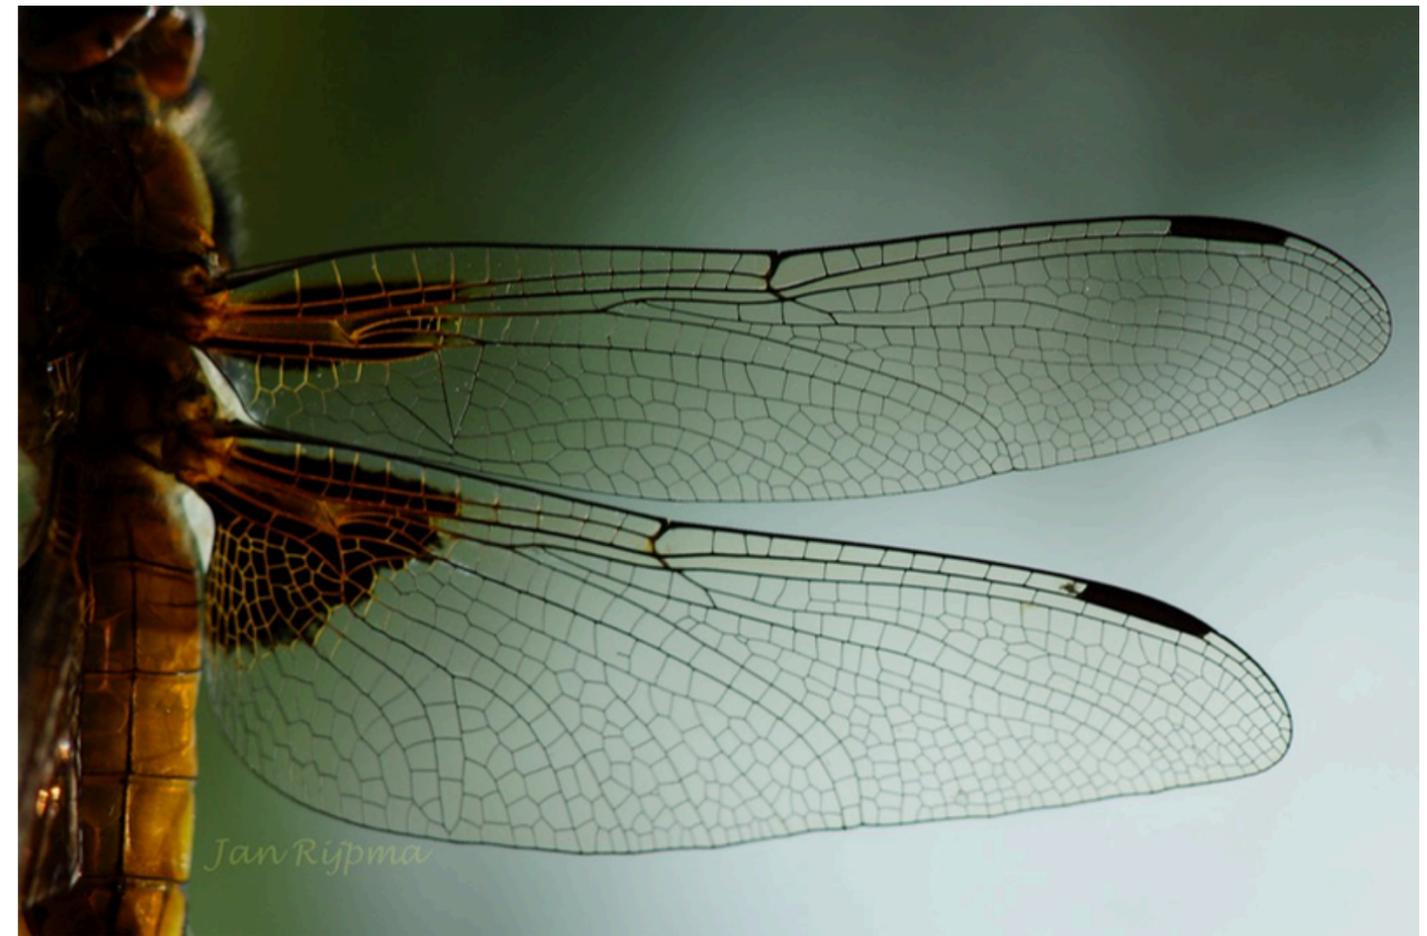

03 LECTURE SUMMARY | VORONOI

What is Voronoi?

- Mathematical Partitioning: Dividing space into cells based on proximity to "seed points."
- Nature's Blueprint
- Organic Efficiency: eliminating "dead corners"

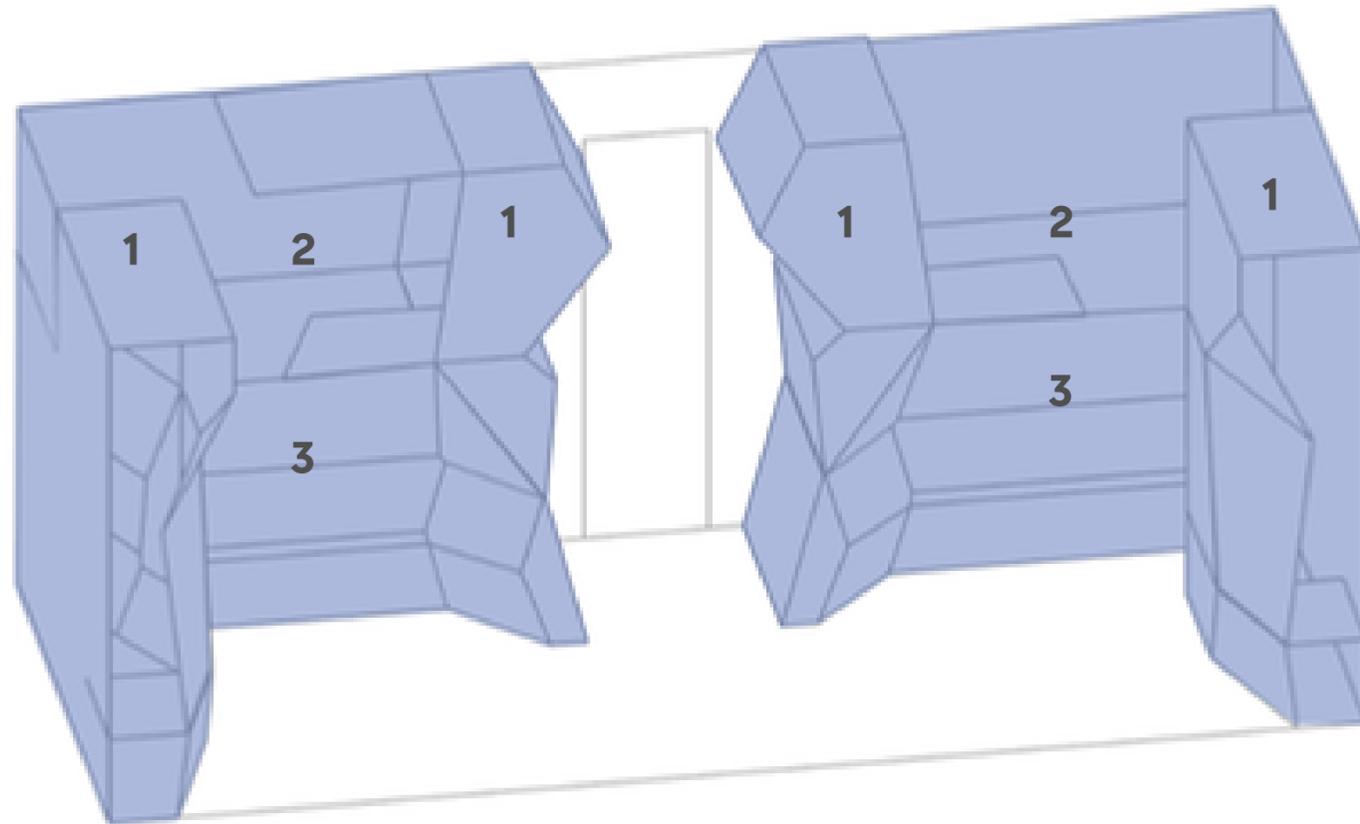

Application & Objective

- Optimal Spatial Efficiency
- Transforming "stiff" furniture into foldable furniture
- Breaking the Box: eliminates "tunnel vision"

O4 ADAPTIVE FURNISHING | OVERVIEW

Distribution principles

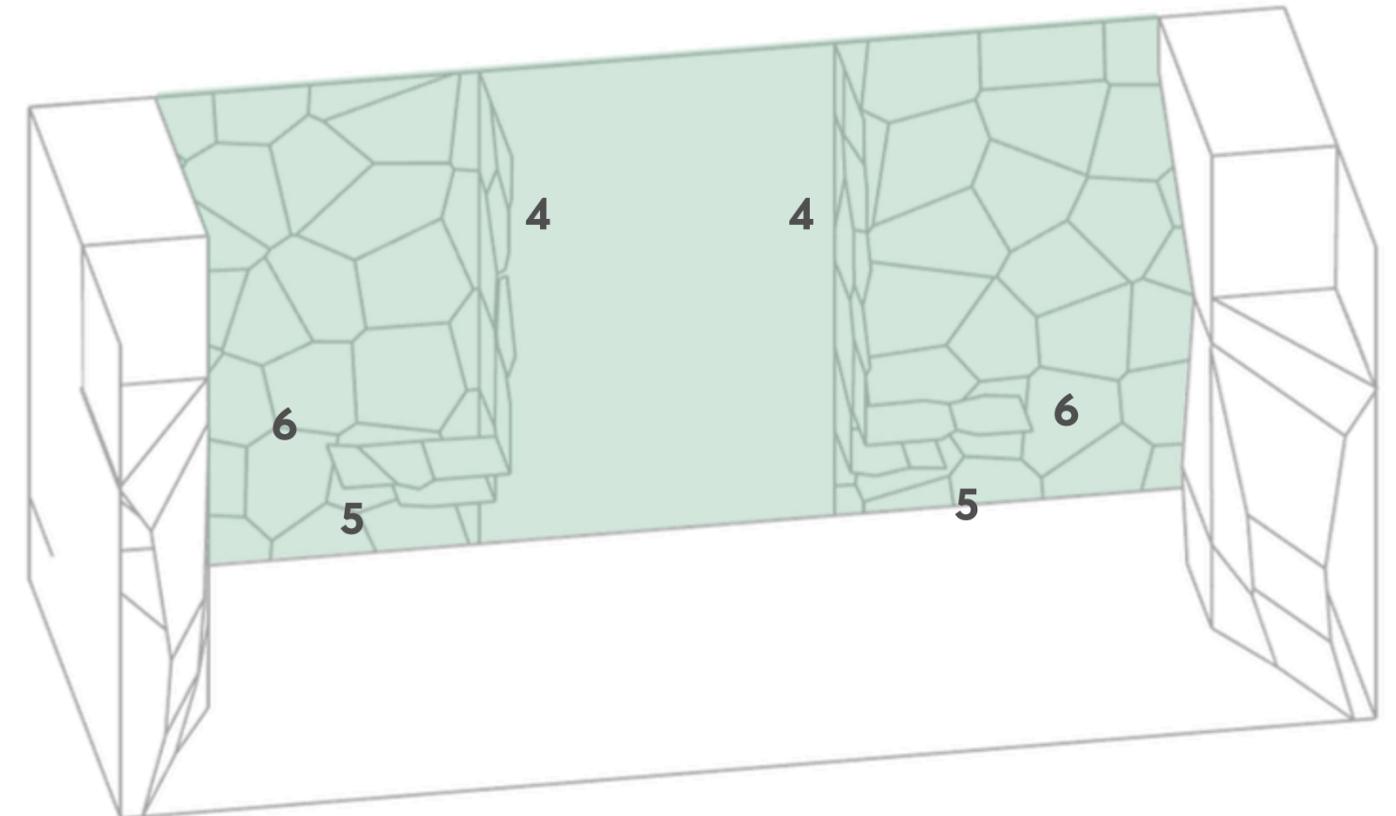

Legend

Static core

More space-consuming and/or fixed furnitures are placed adjacent to the walls. For individual fruition

1. Storage 2. Bed 3. Workstation

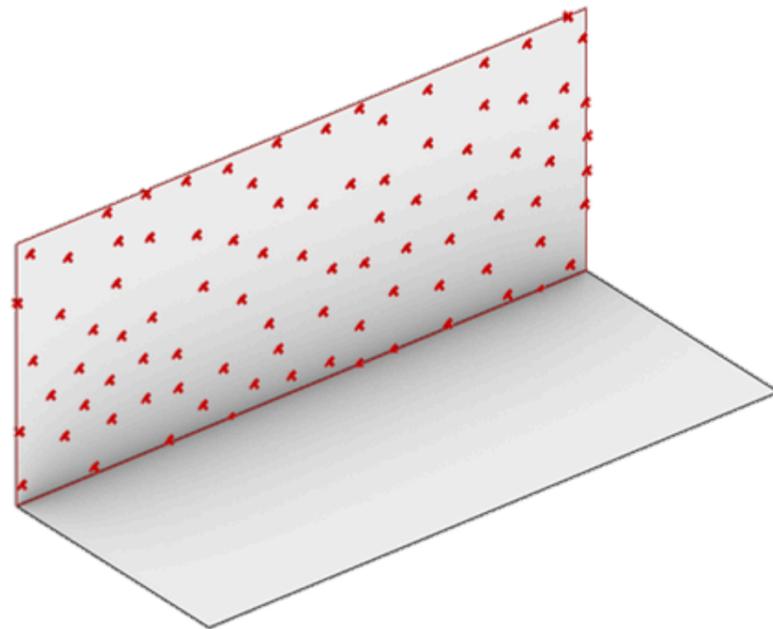

Kinetic skin

Furniture in the center of the container is easily reconfigurable and can be folded to a surface, for maximum clearance of the space. For both collective or individual fruition

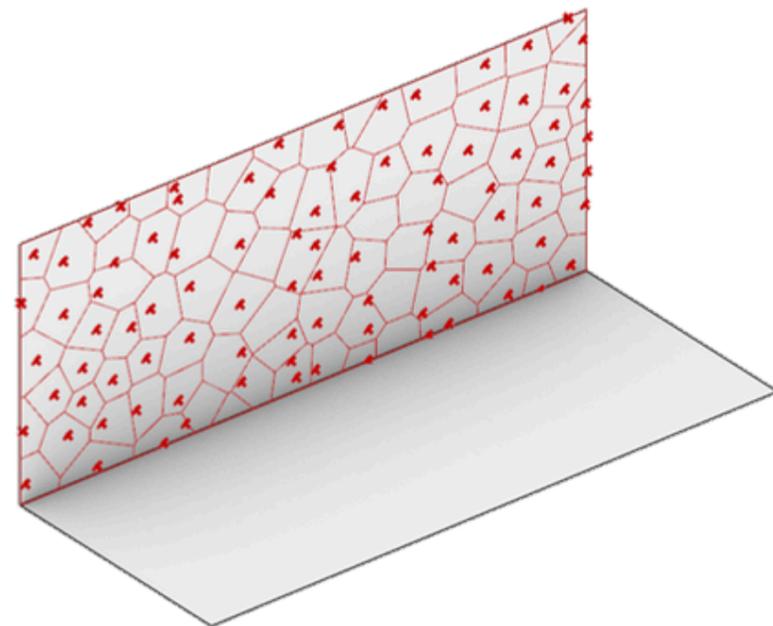

4. Multipurpose room divider 5. Chair/Lounge chair 6. Table

05 KINETIC SKIN | GENERATION PROCESS

Base Voronoi pattern

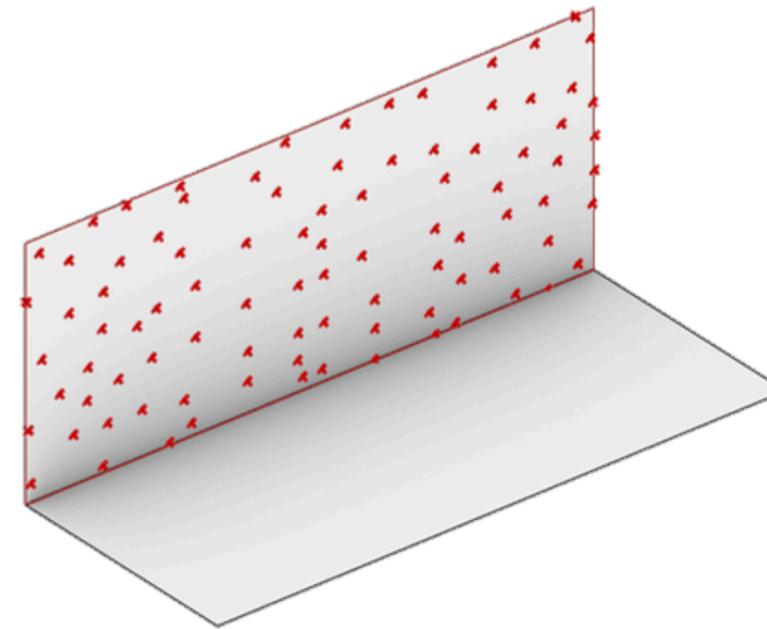

Voronoi points population on the wall plane

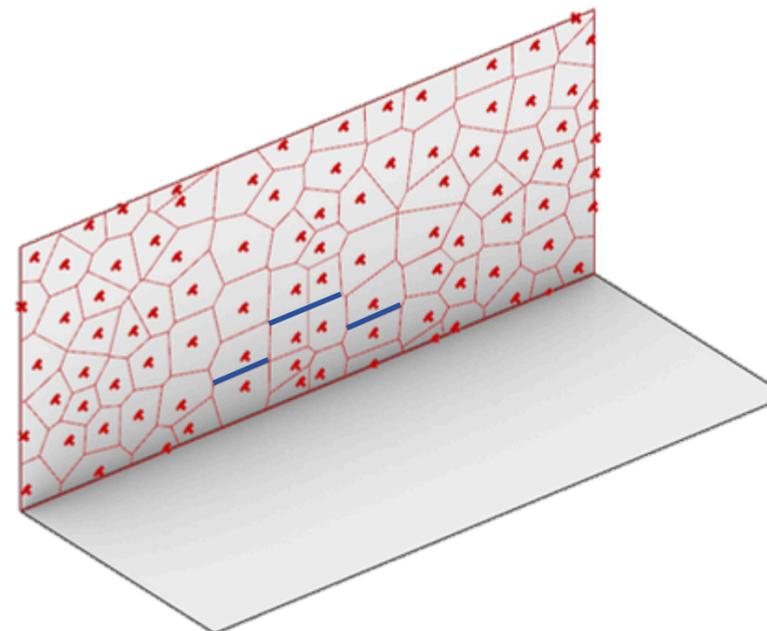

Checking how the generated cells look like

Re-arranged pattern

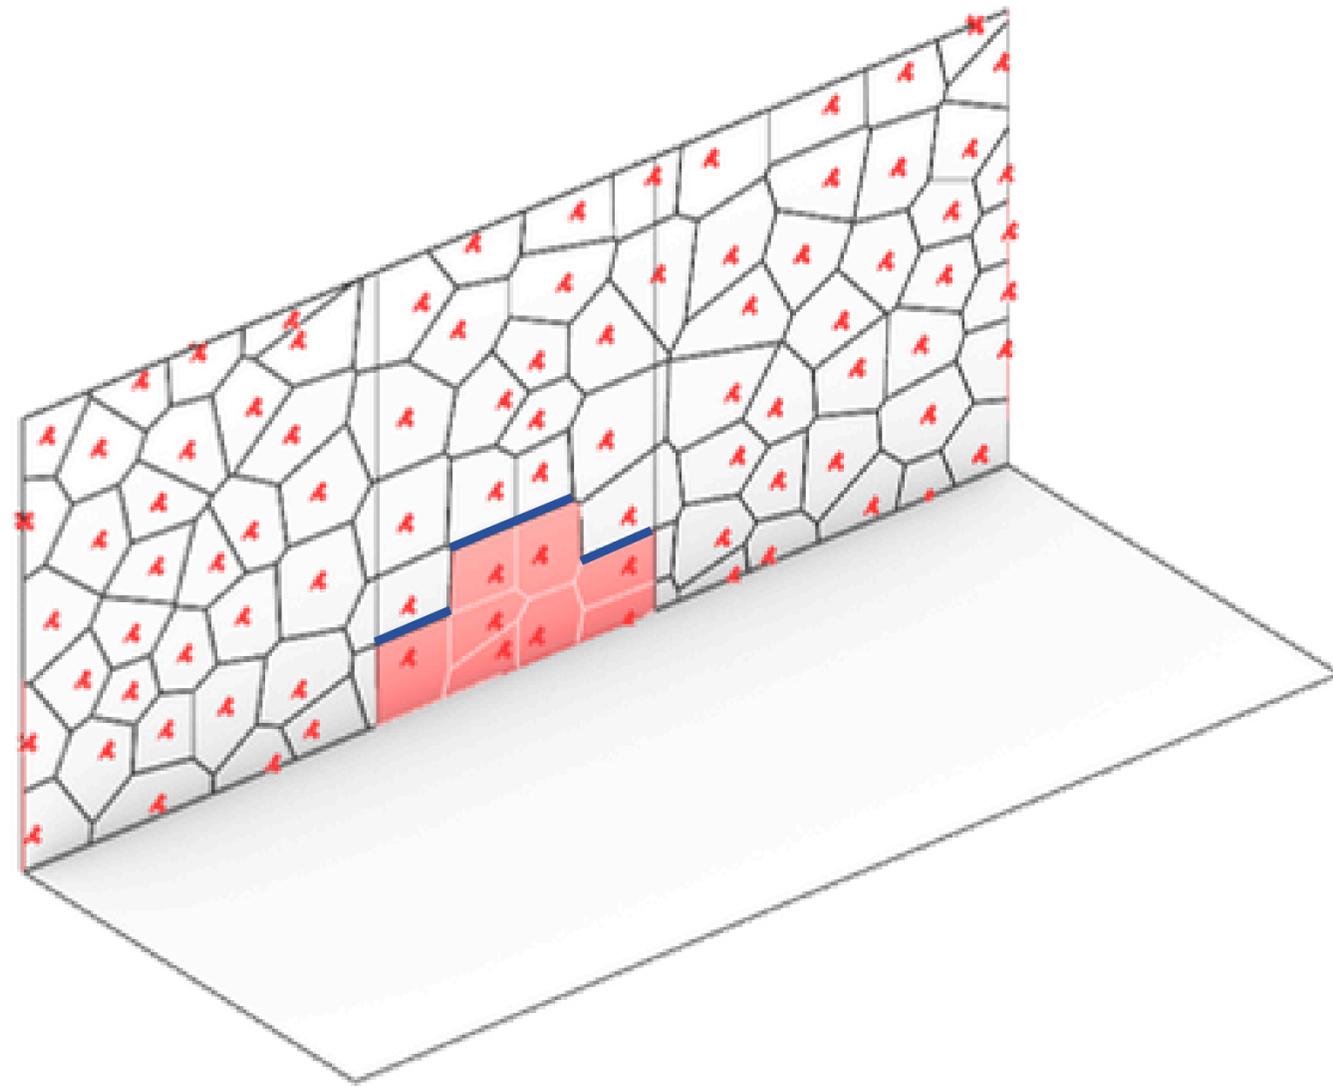

Manually re-arranging the Voronoi points to have horizontal demarcations for folds

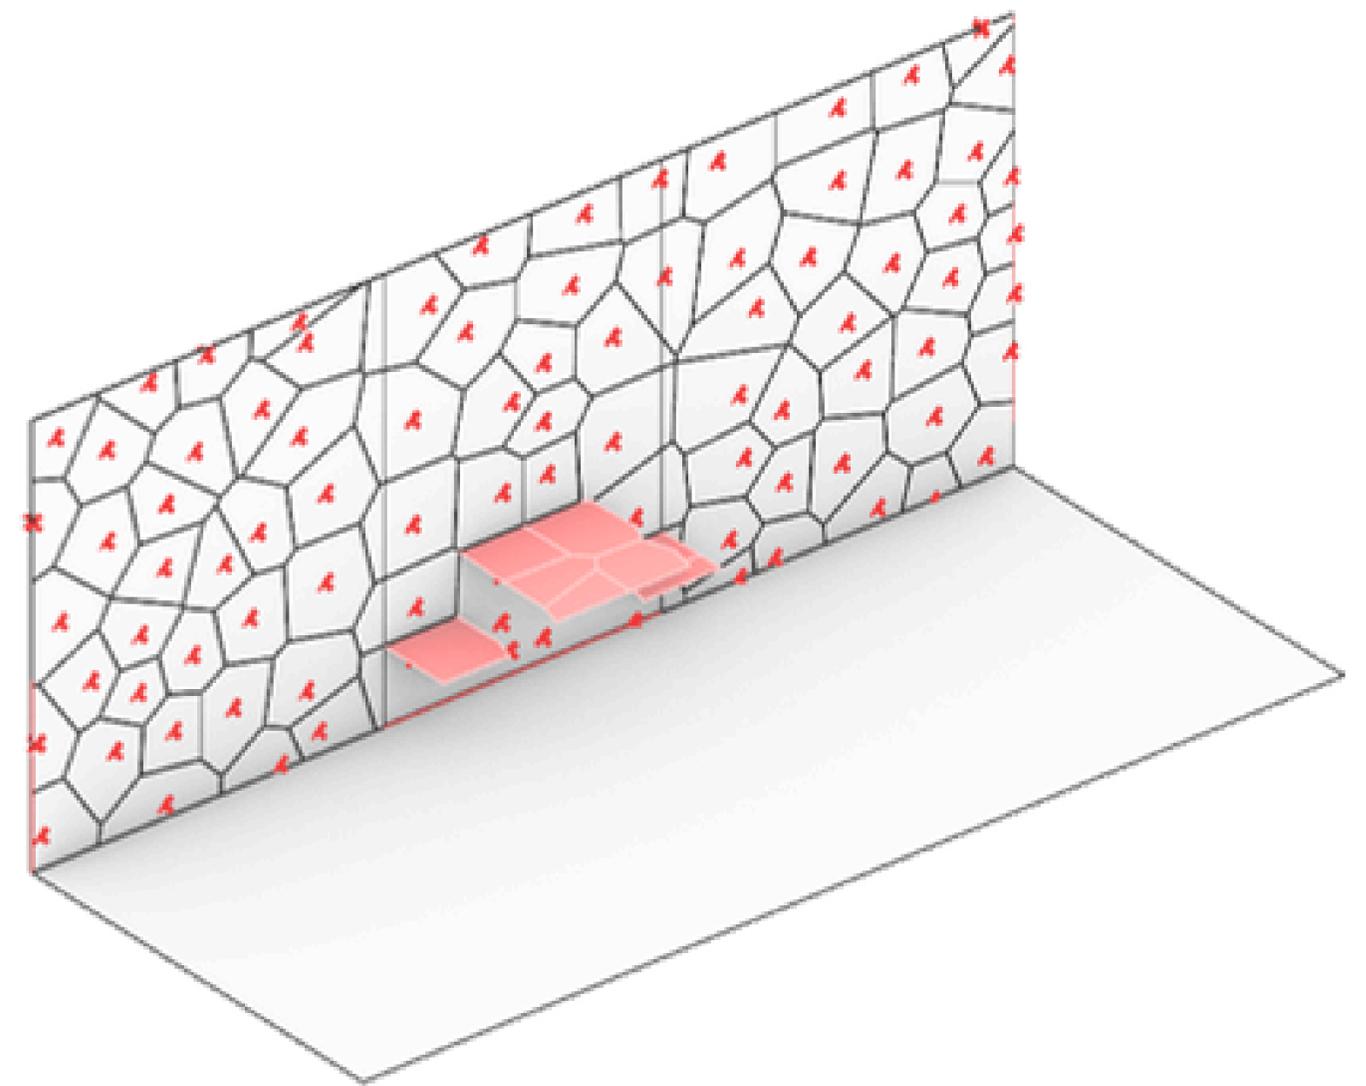

Organization of the newly generated cells

05 KINETIC SKIN | GENERATION PROCESS

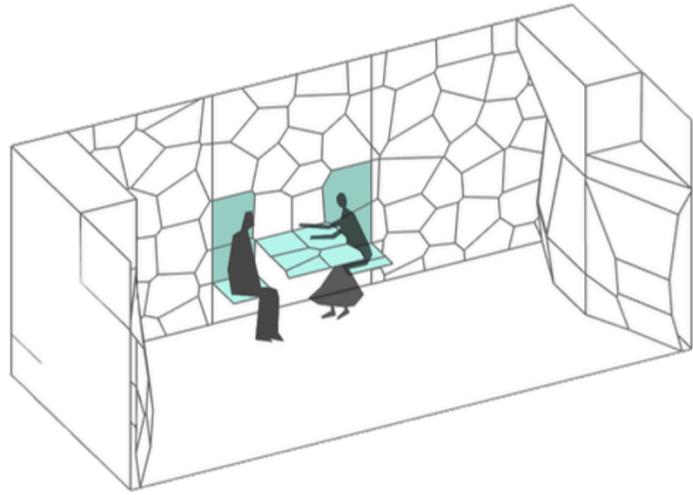

Selecting the cells for the seating and table

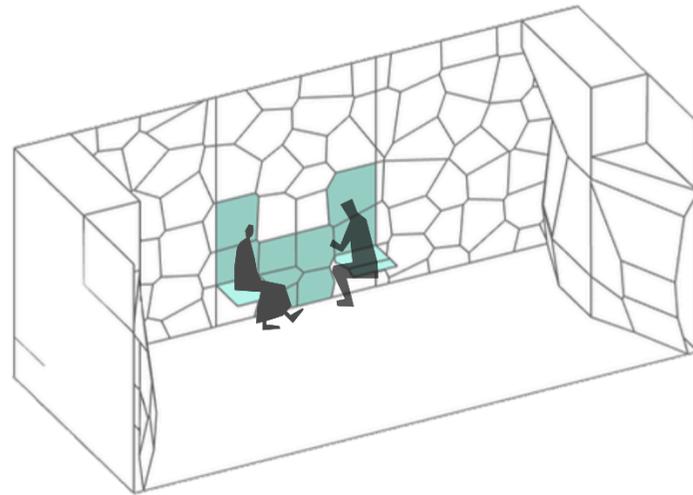

Unfolded seating and table

06 KINETIC SKIN | CONFIGURATIONS

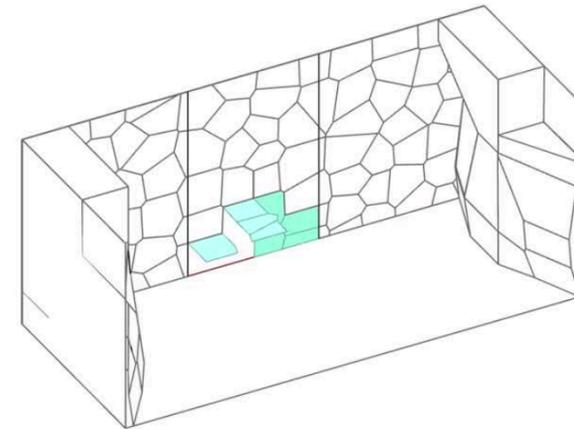

Collective

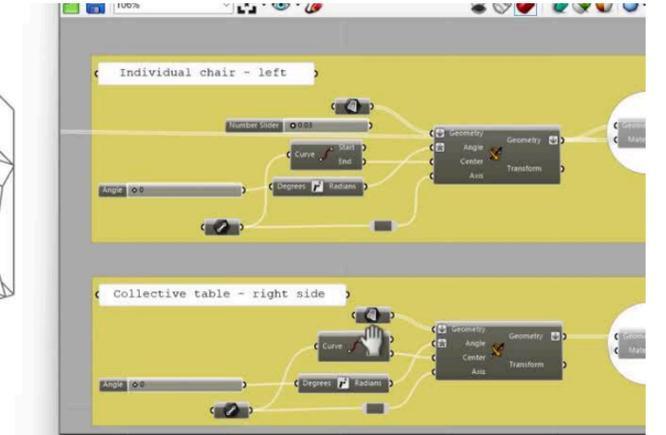

Dining table and chairs open (for dining)
8.00h-9.00h, 13.00h-14.00h, 20.00h-21.00h

Just chairs open (for socialising)
8.00h-9.00h, 13.00h-14.00h, 14.00-18.00
20.00h-21.00h

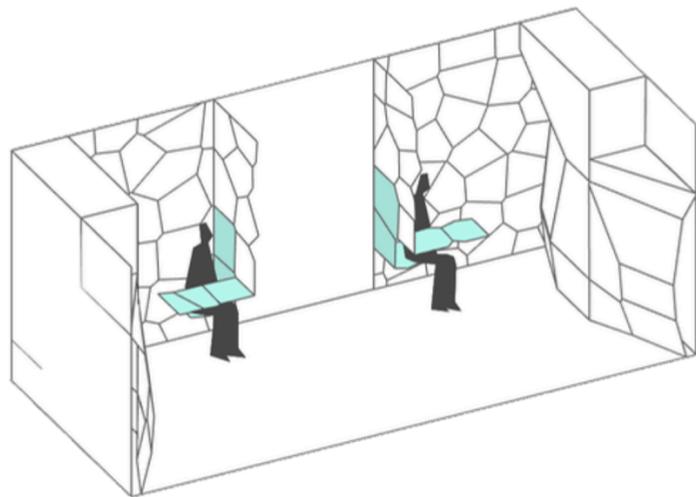

Everything closed (for collective excercising)
18.00h-20.00h

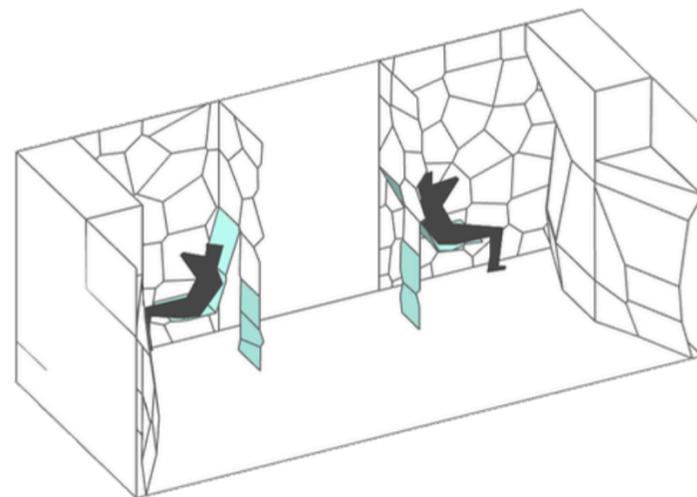

06 KINETIC SKIN | CONFIGURATIONS

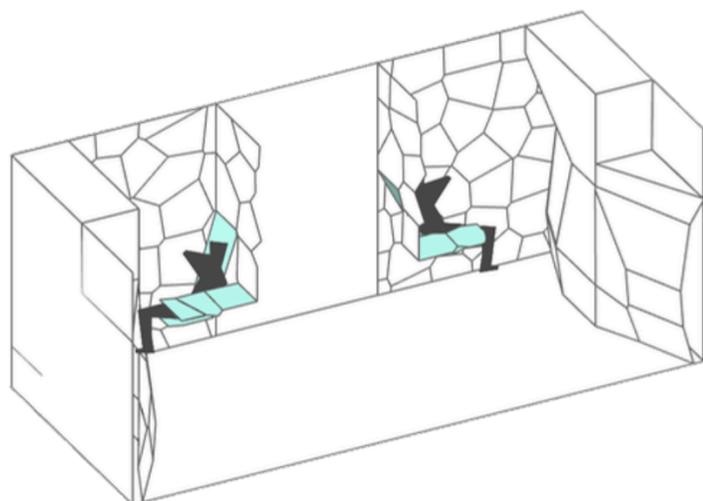

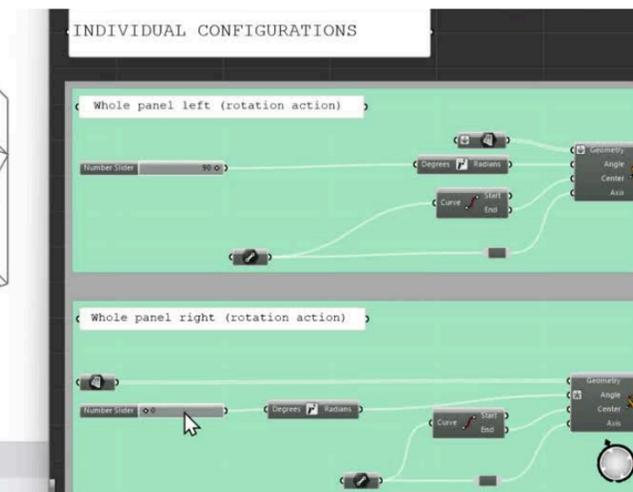

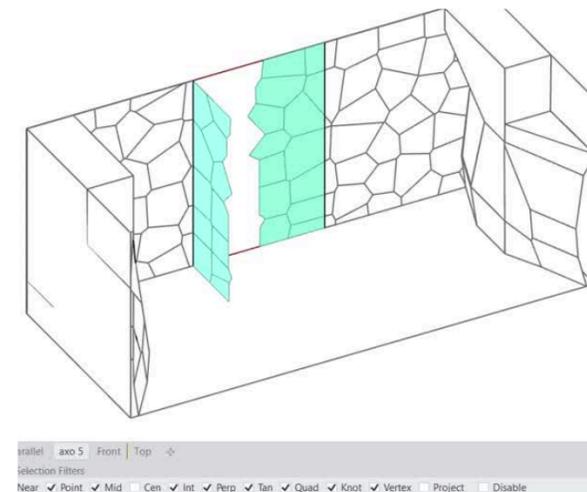

Individual

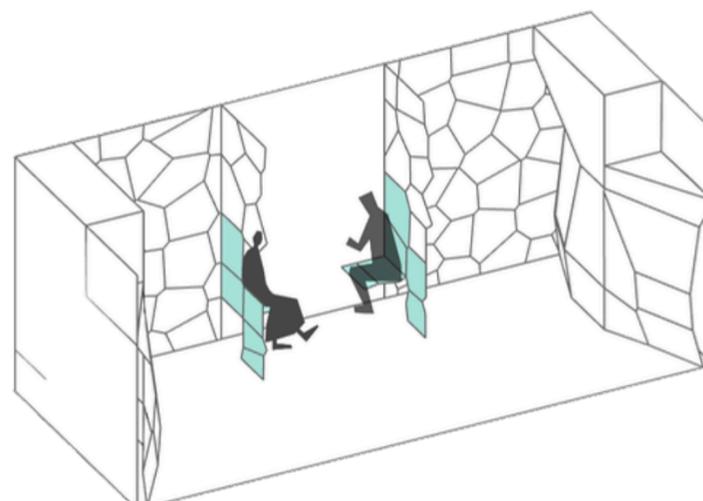

Individual table + chair open (for individual dining)
8.00h-9.00h, 13.00h-14.00h, 20.00h-21.00h

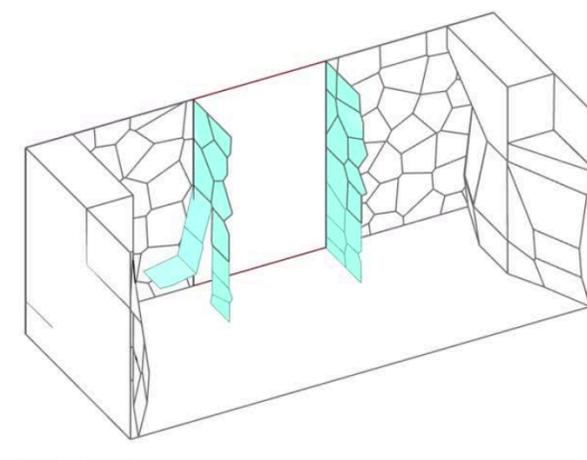

Lounge chairs open (for resting)
18.00h-20.00h, 21.00-22.00

Lounge chair + individual table open (for resting with side table next to it)
18.00h-20.00h, 21.00h-22.00h

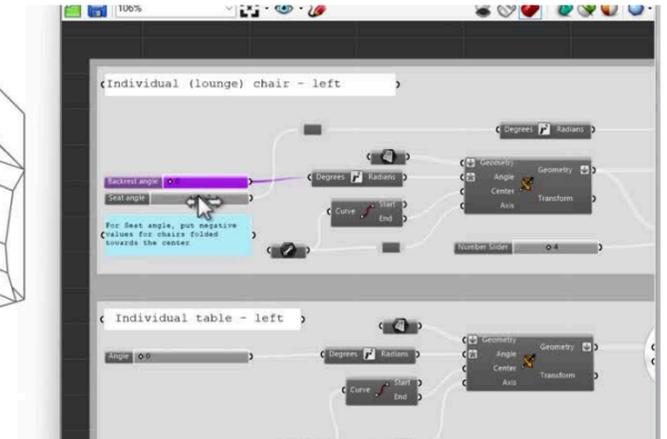

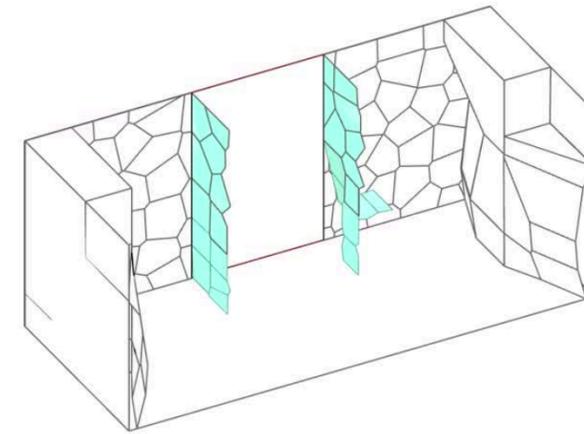

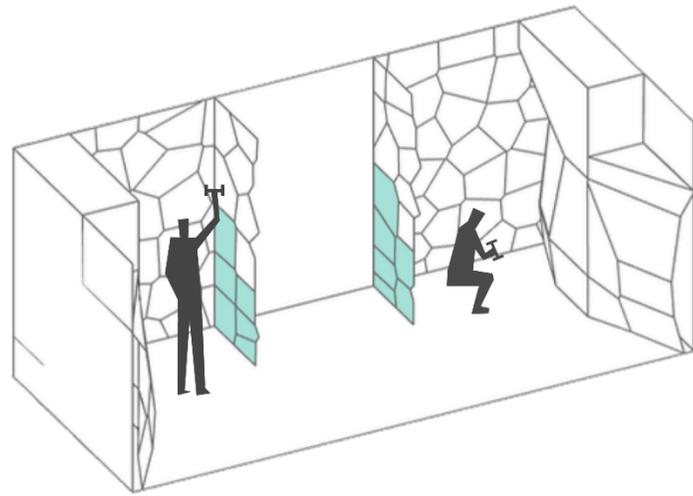

Chairs folded towards the center (for socialising while maintaining privacy inside the room)
9.00h-13.00h

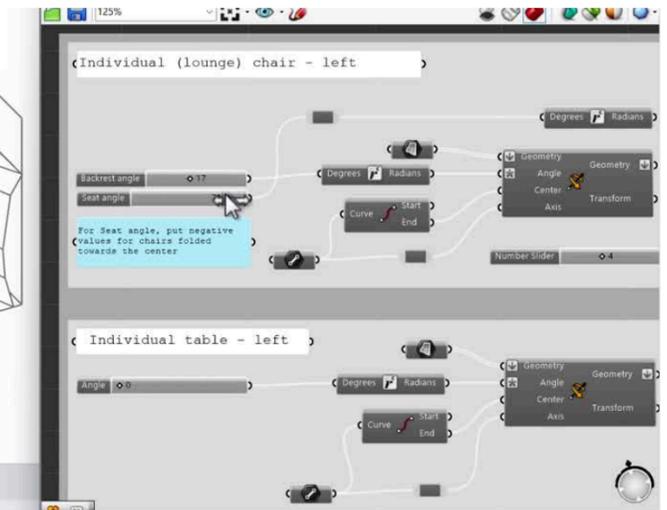

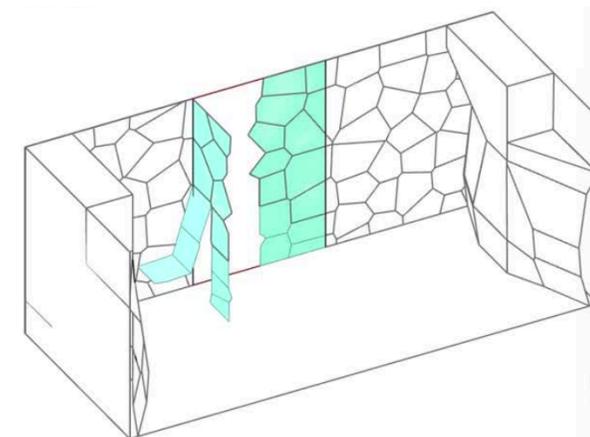

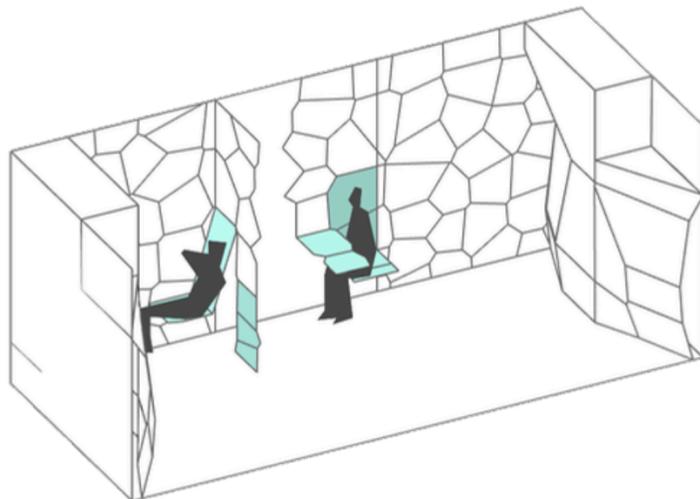

06 KINETIC SKIN | CONFIGURATIONS

Individual

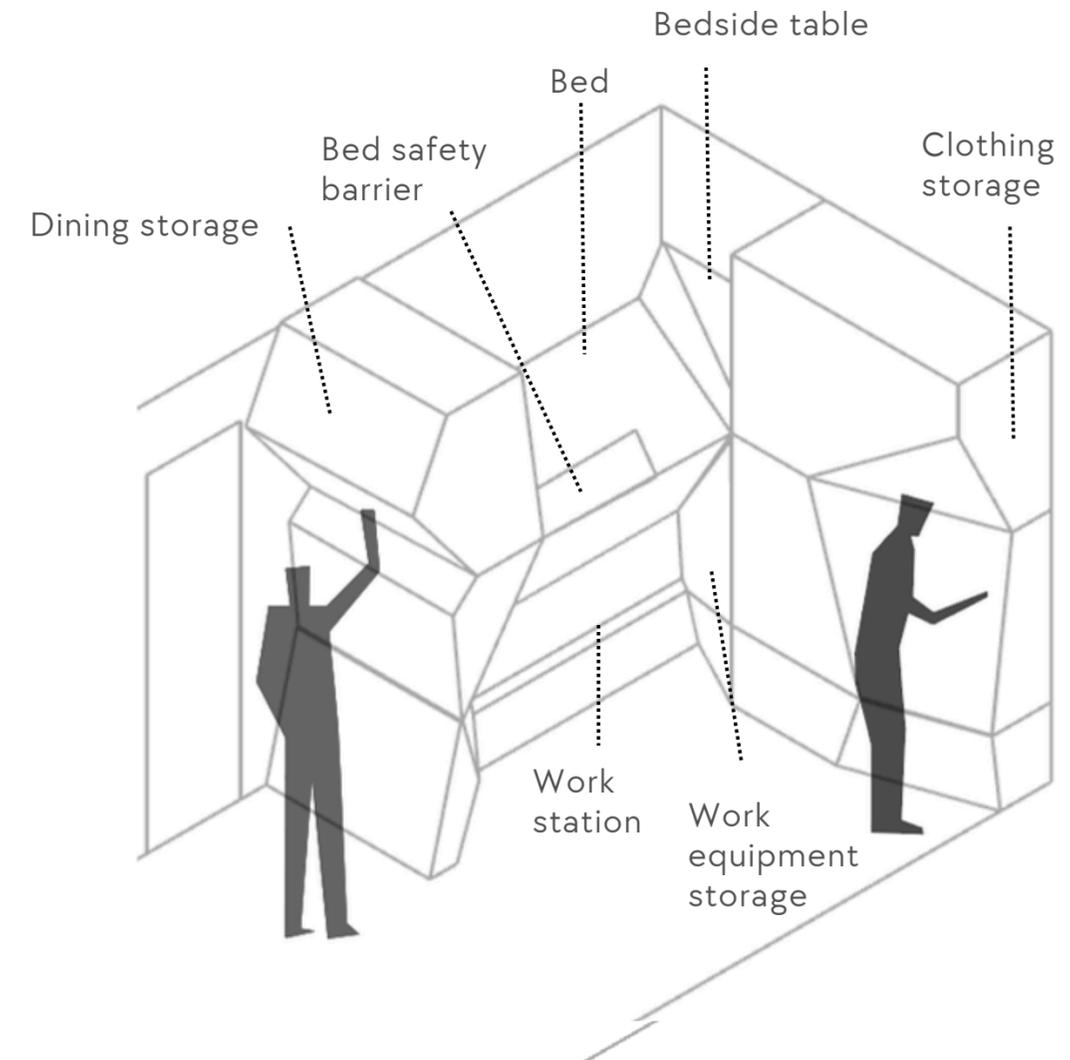

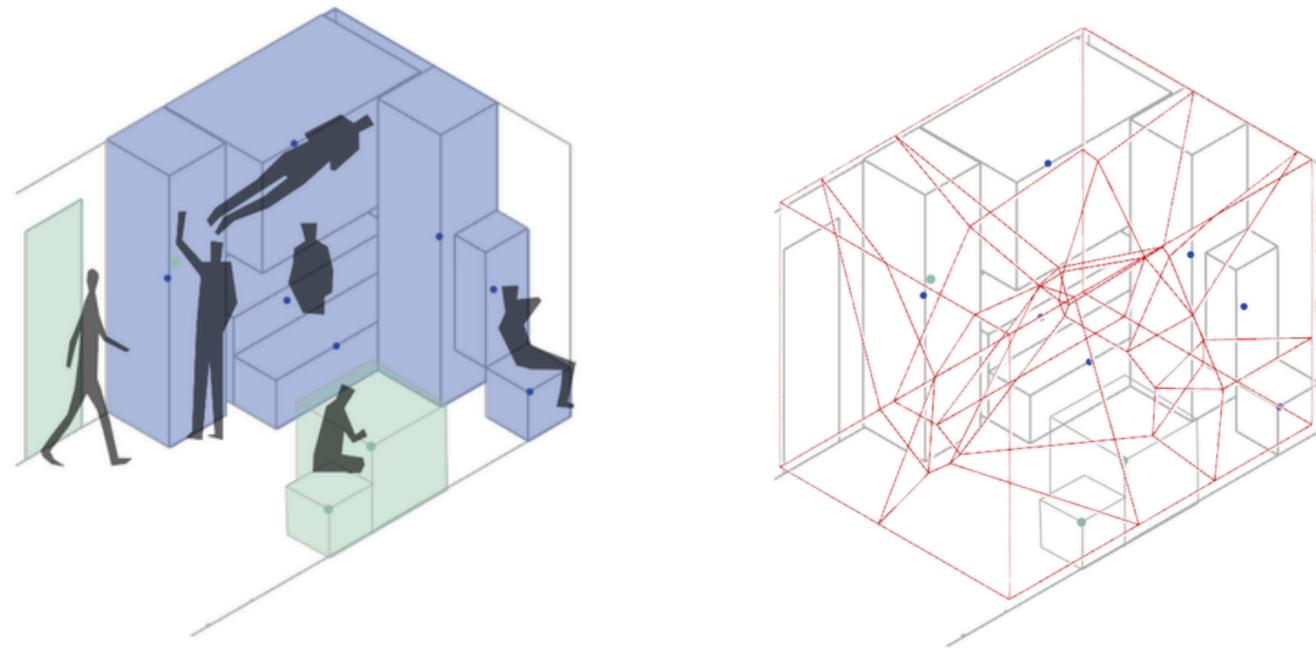

Just wall (for individual exercising) 18.00h-20.00h

Hybrid

Lounge chair in individual configuration, dining in collective one 18.00h-20.00h

07 STATIC CORE | GENERATION PROCESS

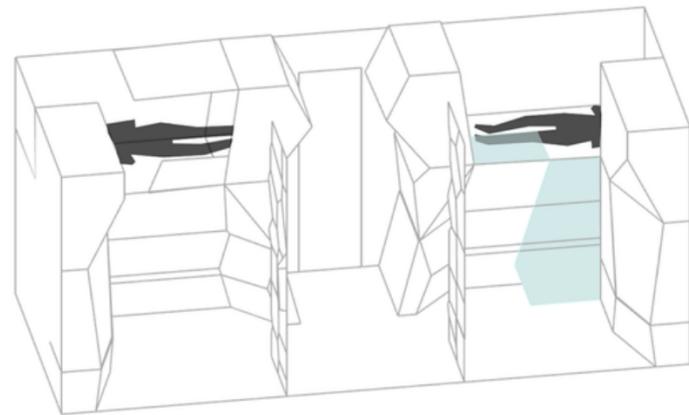

Process

1. **Optimisation of activities distribution in space**
minimal dimensions obtained from activity mapping
2. **Centroids as seeds points**
minimal dimensions obtained from activity mapping

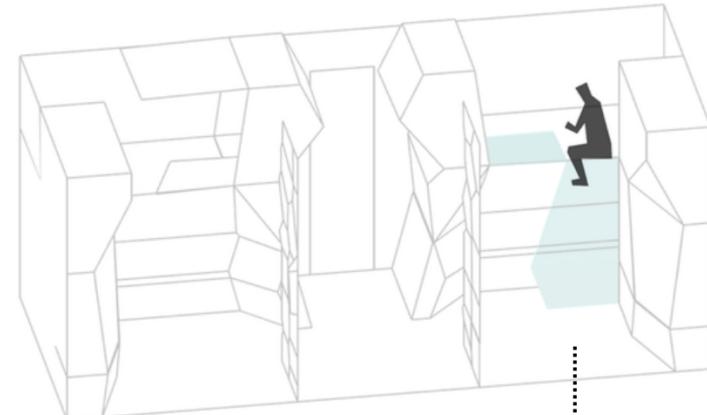

Optimised ergonomic design

08 ADAPTIVE FURNISHING | 24H MAPPING

6.00-7.00: Waking up & Hygiene - User 1

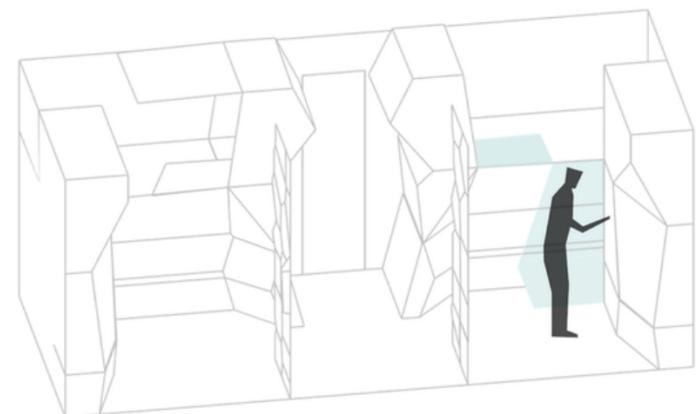

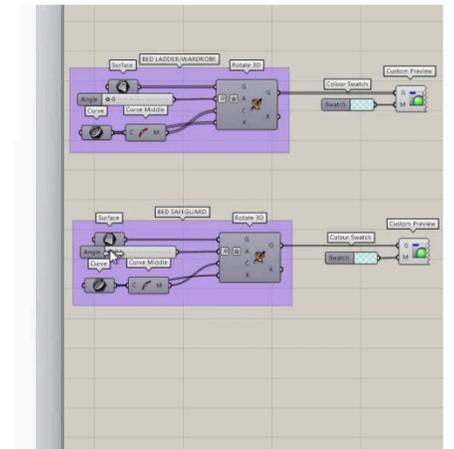

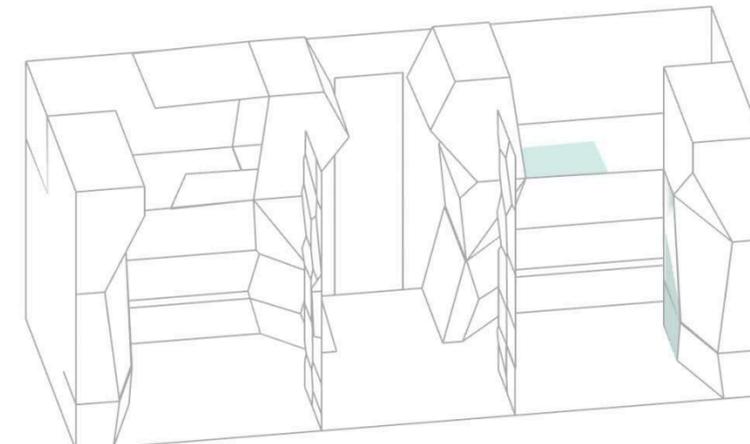

Waking up

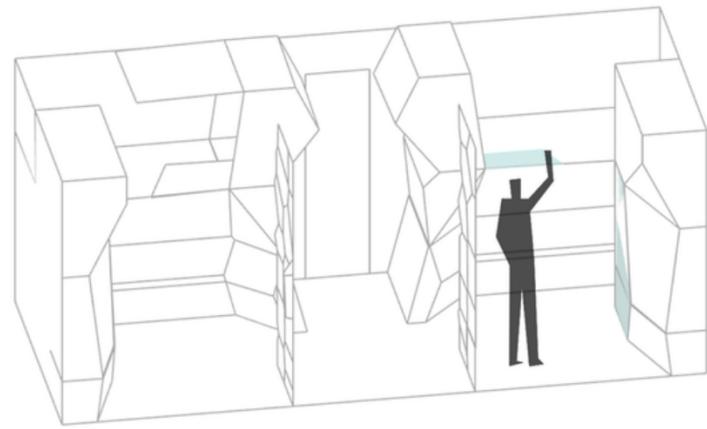

Getting off the bed

Bed ladder integrated in clothing storage surface

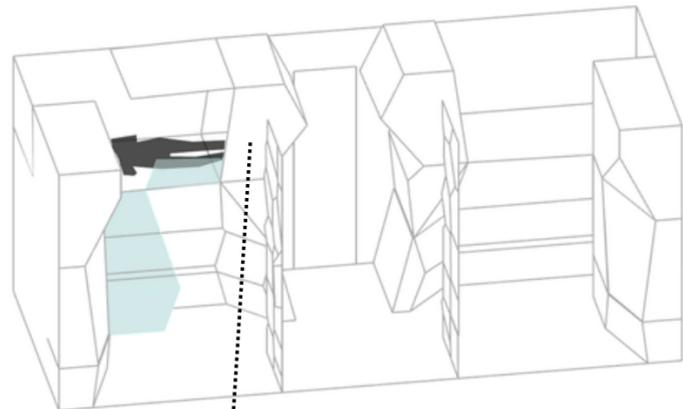

Getting clothes from wardrobe

Closing wardrobe and bed safety barrier

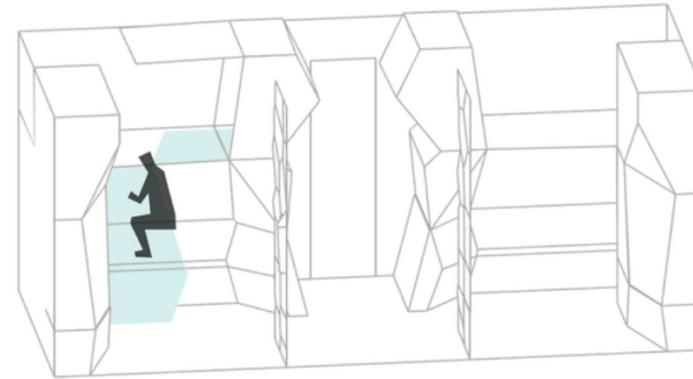

08 ADAPTIVE FURNISHING | 24H MAPPING

7.00-8.00: Waking up & Hygiene - User 2

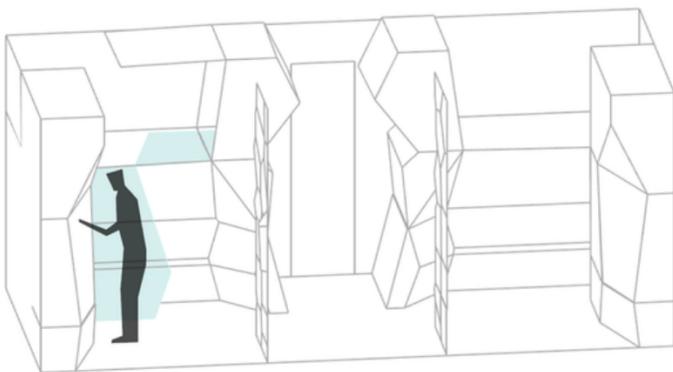

Waking up

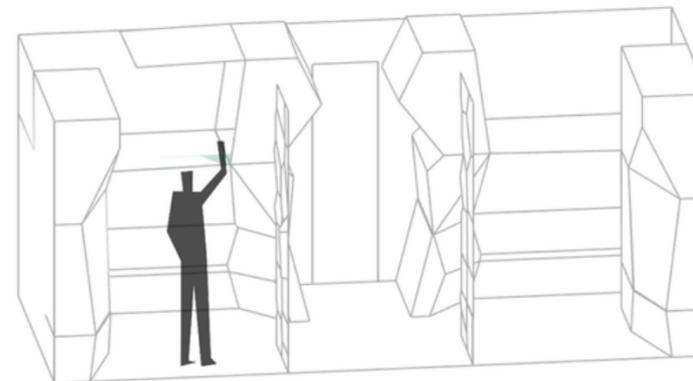

Extended bed
(alternatively serving as
additional storage)

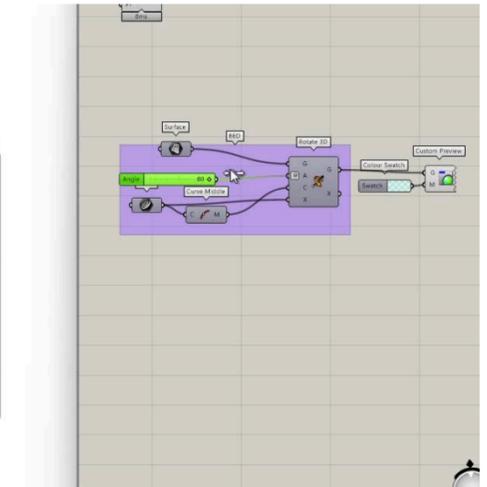

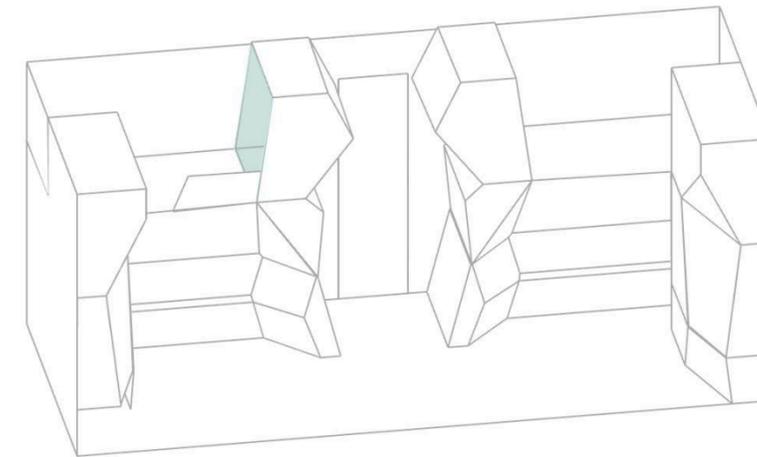

Getting off the bed

Getting clothes from wardrobe

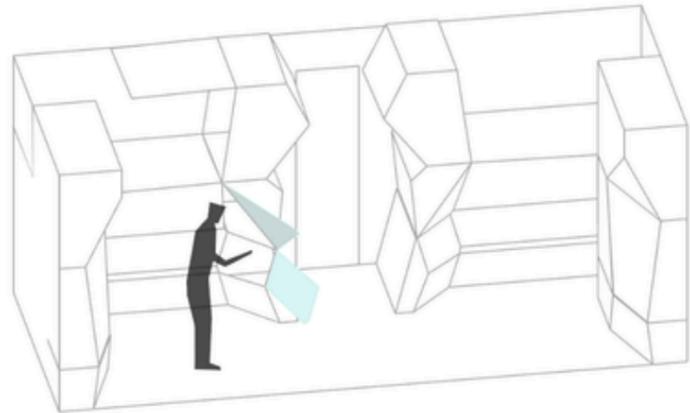

Closing wardrobe and bed safety barrier

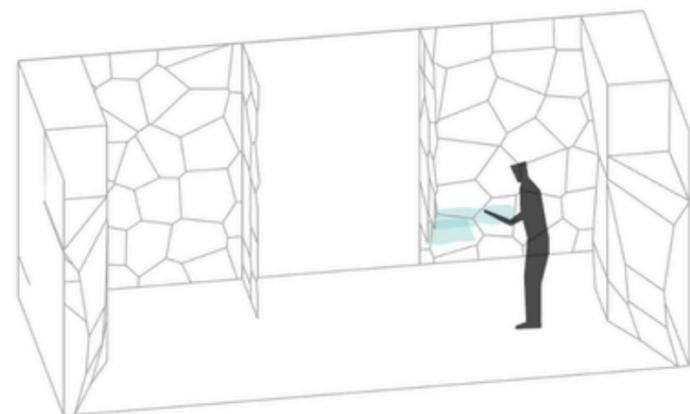

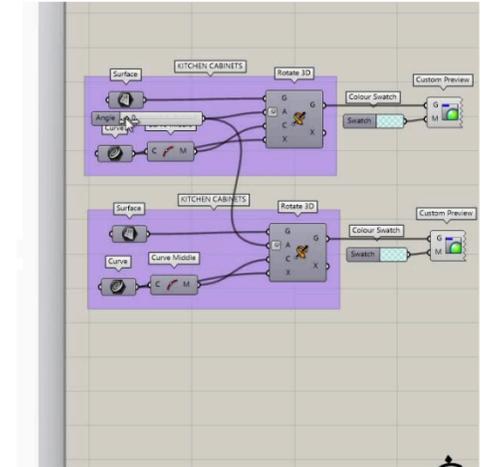

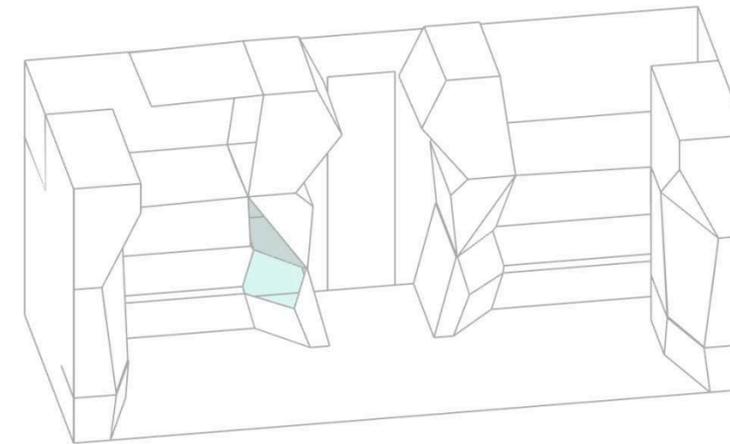

08 ADAPTIVE FURNISHING | 24H MAPPING

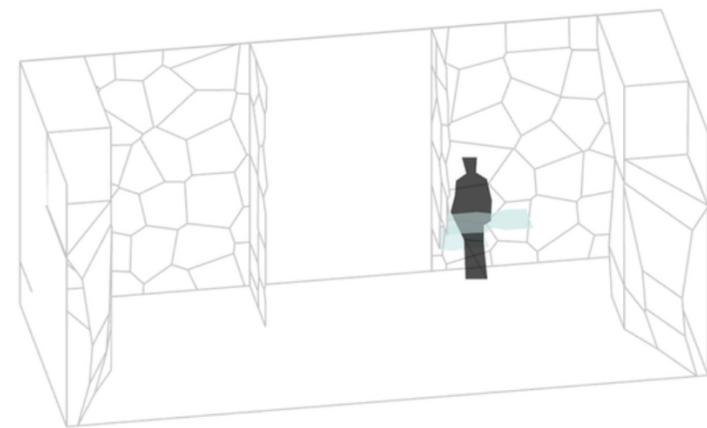

8.00-9.00: Individual Dining - User 2

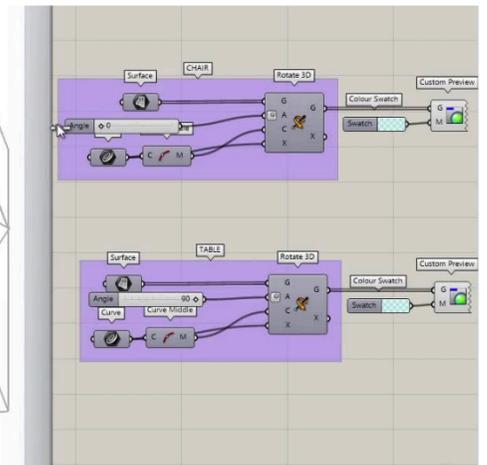

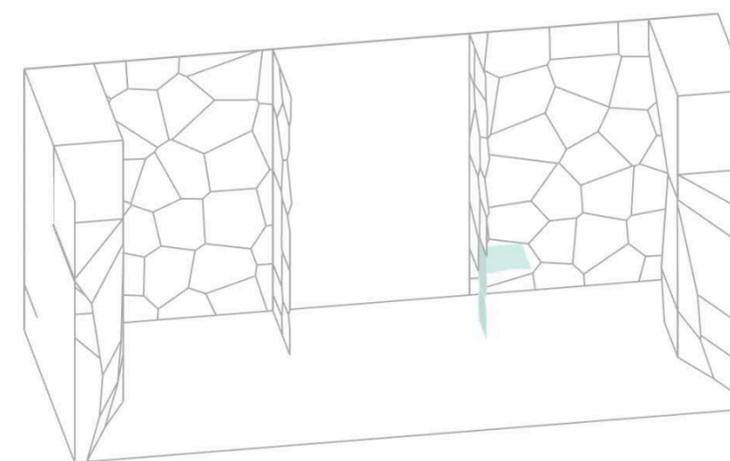

Getting food/dishes from kitchen storage

Folding out dining chair and table

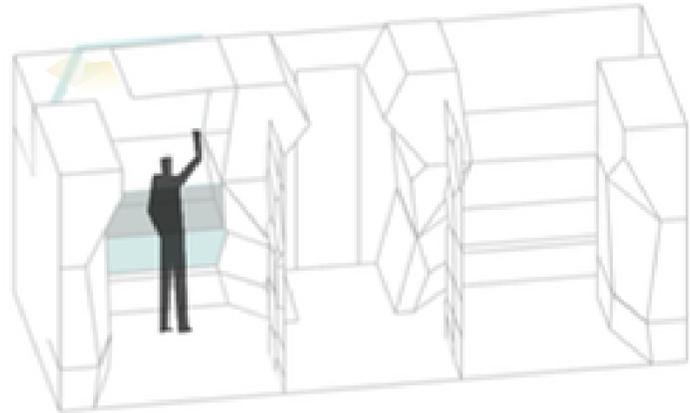

Having breakfast

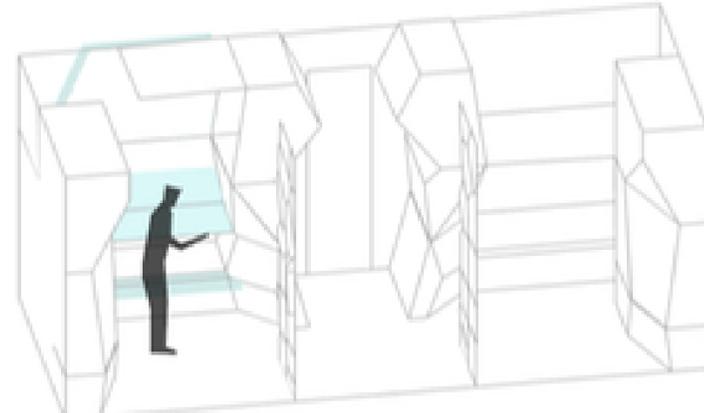

08 ADAPTIVE FURNISHING | 24H MAPPING

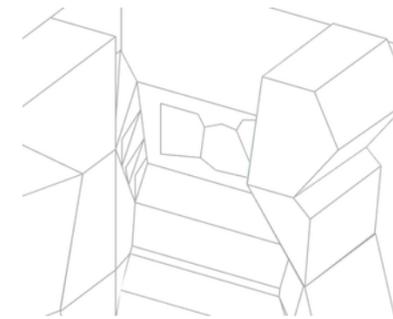

9.00-13.00: Individual Working - User 2

Folding away bed

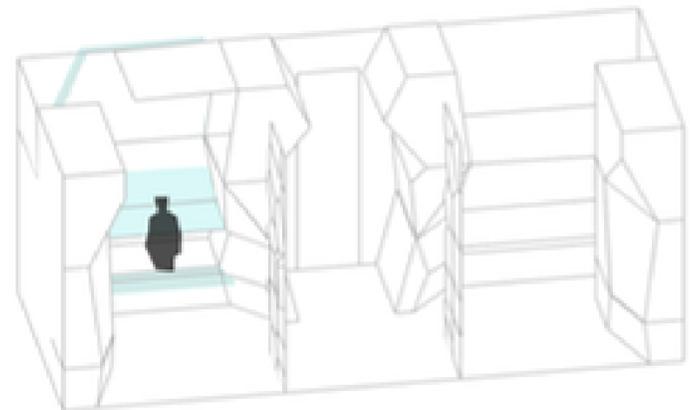

Folding out desk and work bench

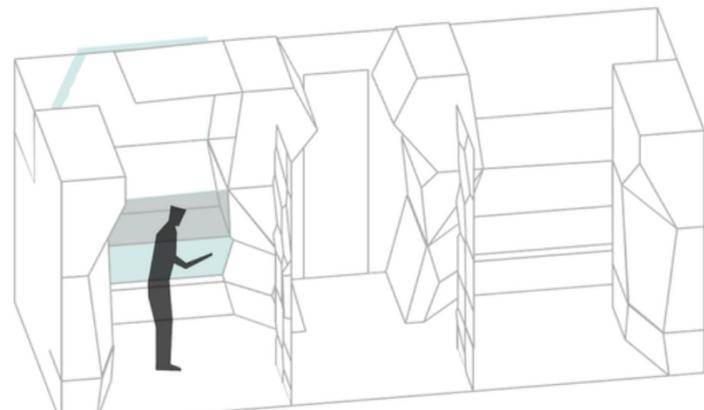

allows fruition of window and storage

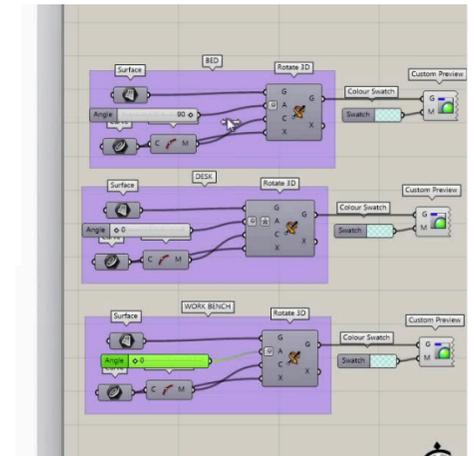

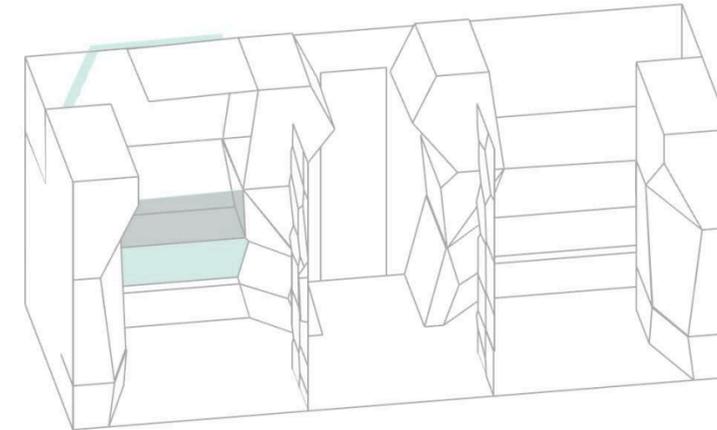

Allows fruition of larger space in height, natural light and view of the sky from skylight above bed

Working

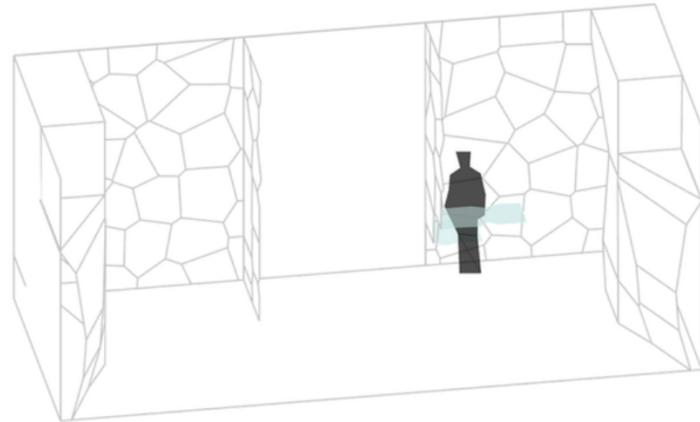

Folding in desk and work bench

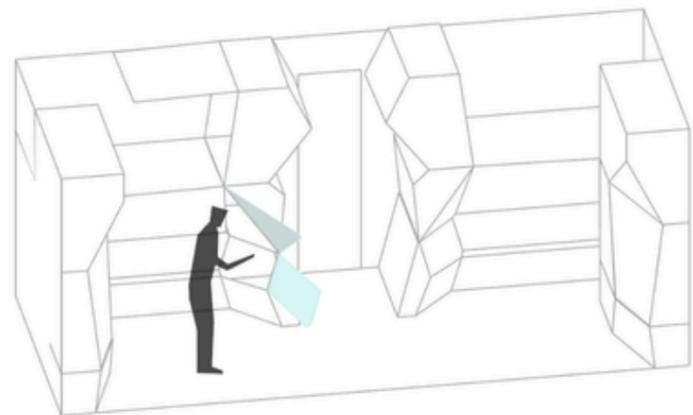

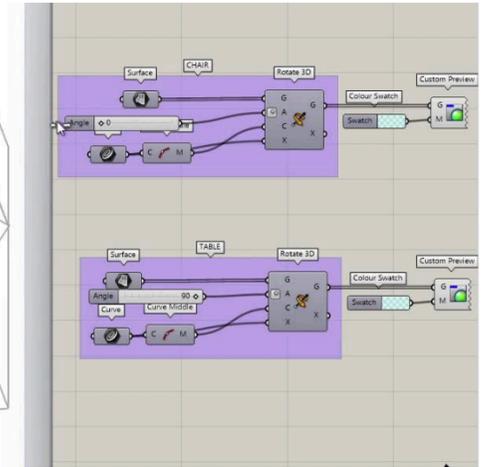

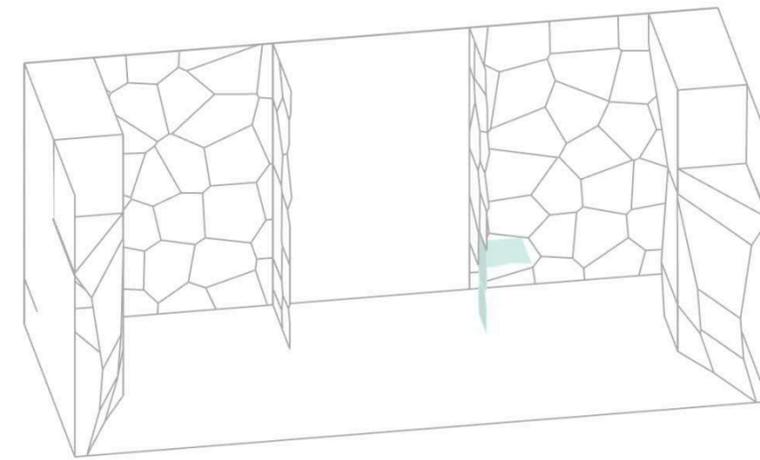

08 ADAPTIVE FURNISHING | 24H MAPPING

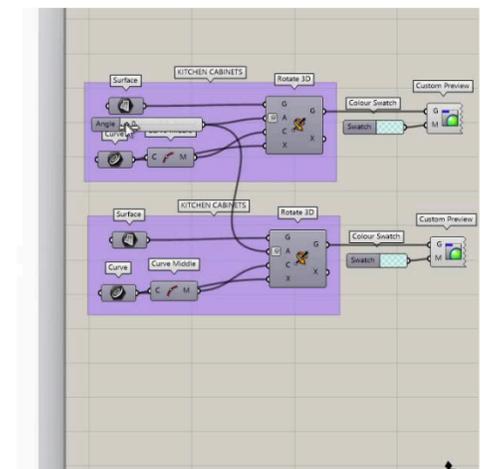

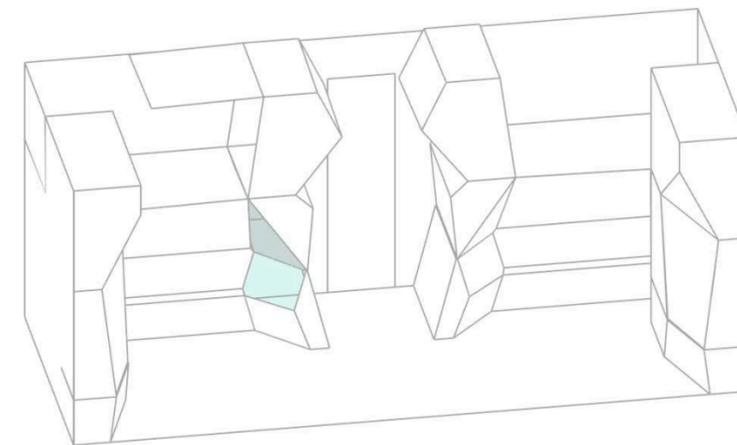

13.00-14.00: Individual Dining - User 2

Having lunch

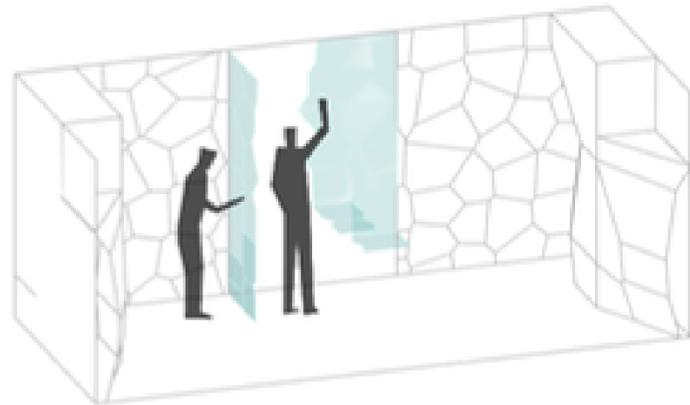

Putting food/dishes back in kitchen storage

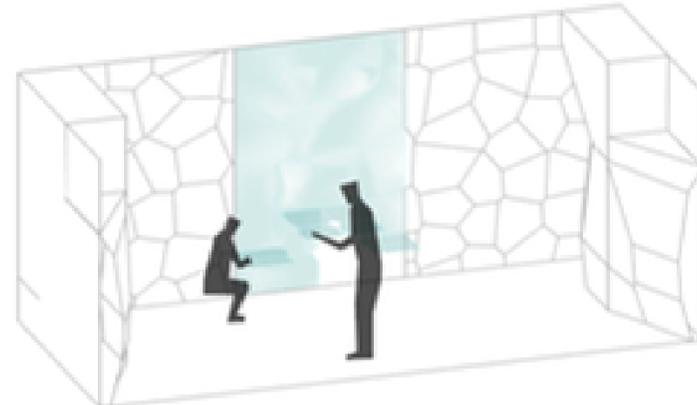

08 ADAPTIVE FURNISHING | 24H MAPPING

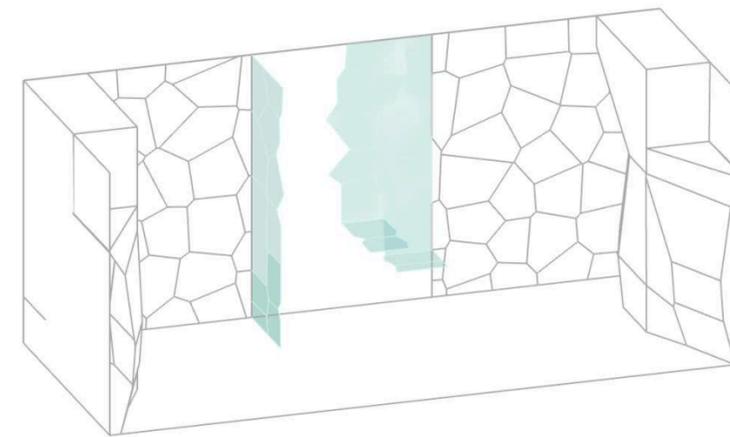

14.00-18.00: Collective Working

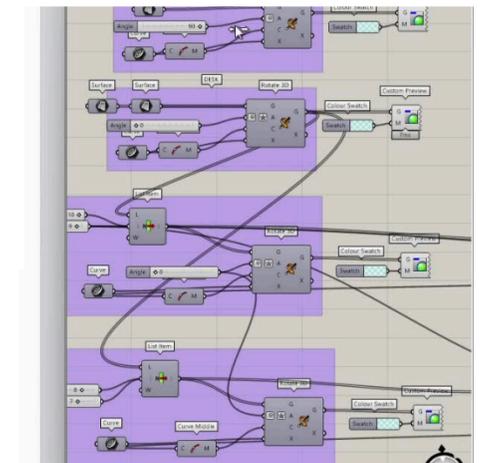

Reconfiguring walls

Folding out table and chair

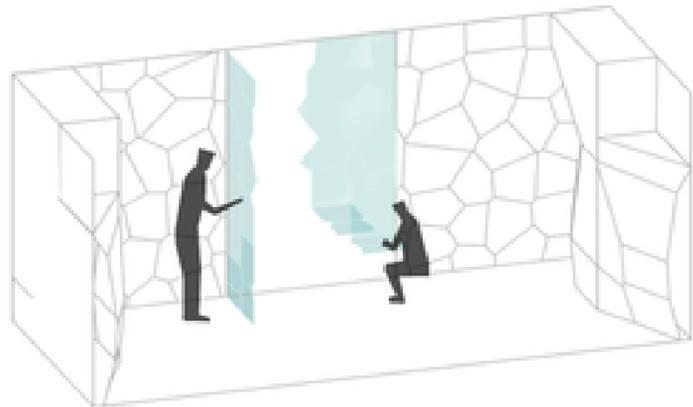

Working

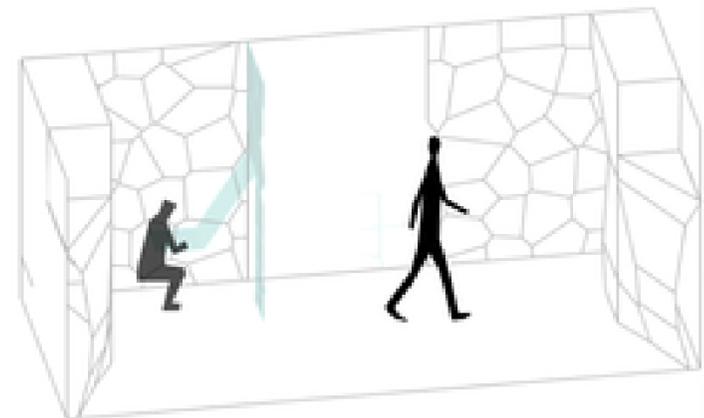

08 ADAPTIVE FURNISHING | 24H MAPPING

18.00-20.00: Relaxing/Exercising

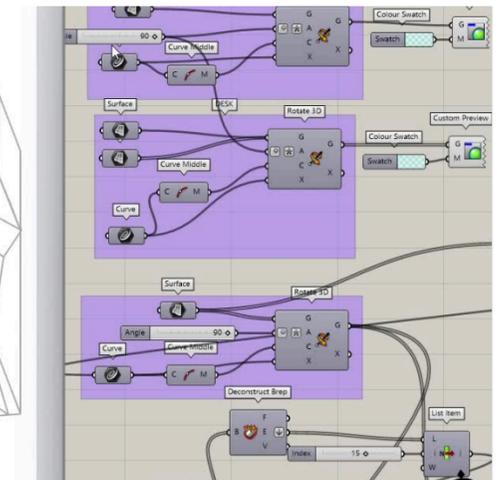

Reconfiguring walls

Folding out lounge chair

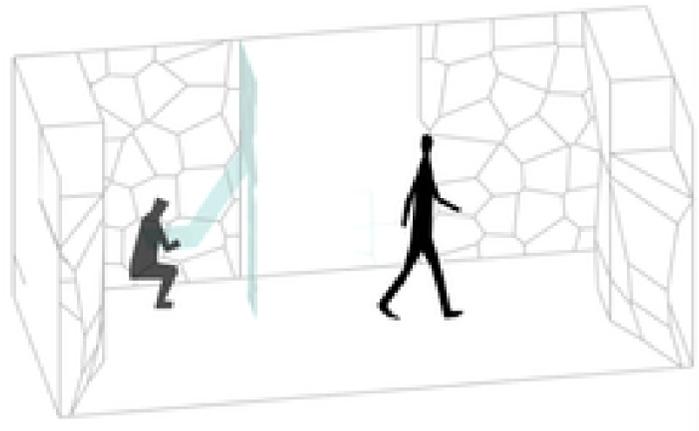

Relaxing/exercising

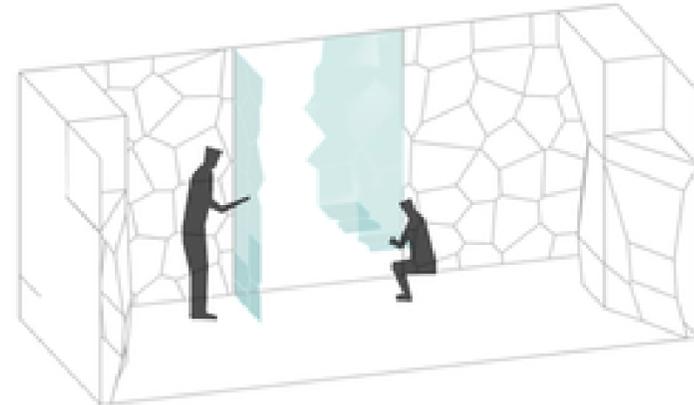

08 ADAPTIVE FURNISHING | 24H MAPPING

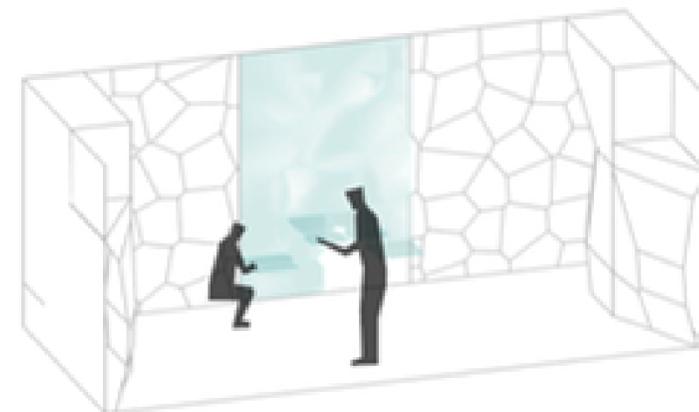

20.00-21.00: Collective dining

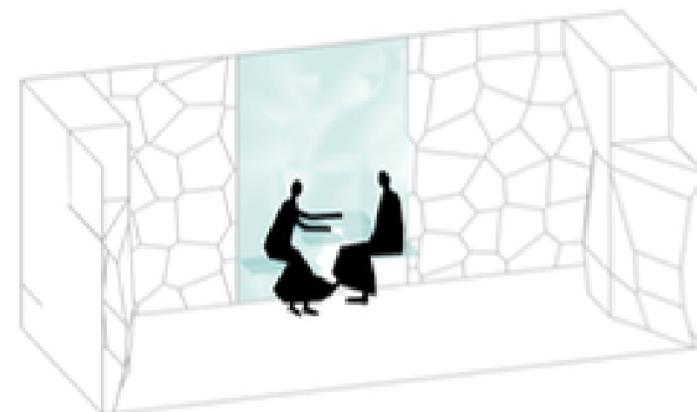

Folding away lounge chair

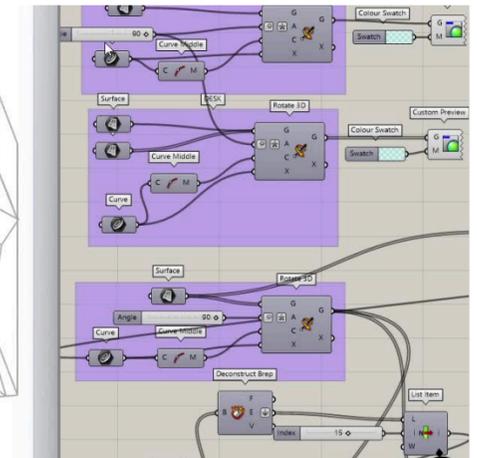

Reconfiguring walls

Folding out table and chairs

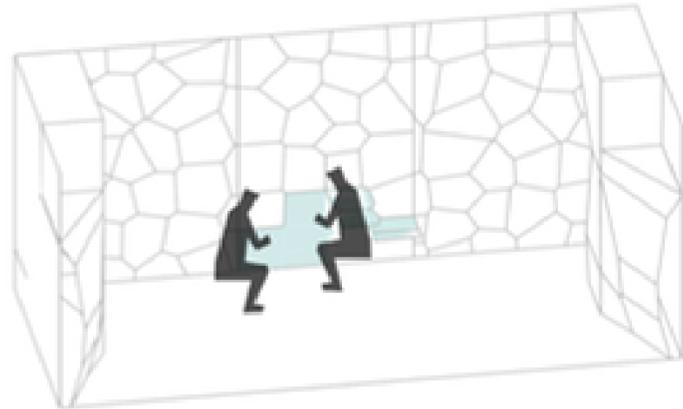

Dining

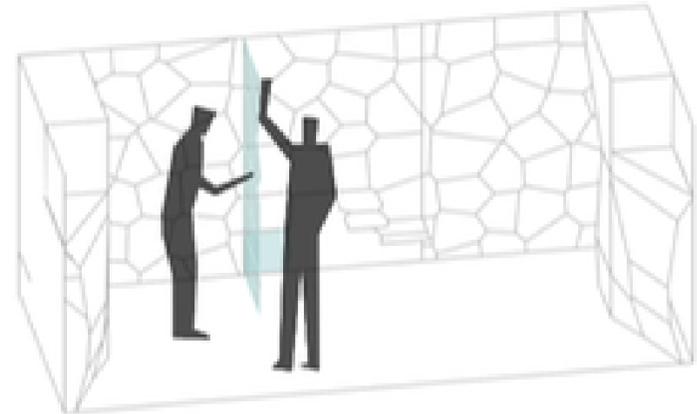

08 ADAPTIVE FURNISHING | 24H MAPPING

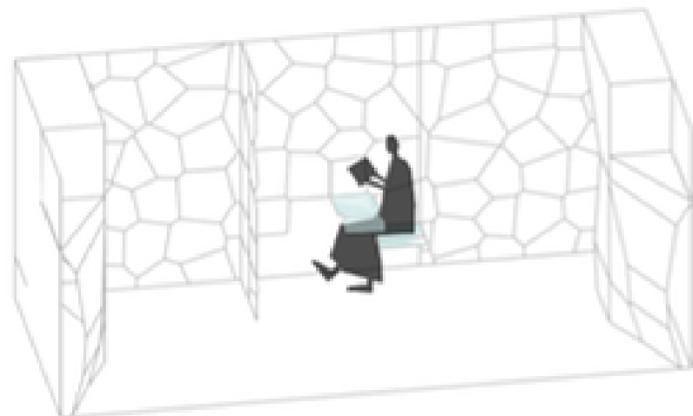

21.00-22.00: Relaxing

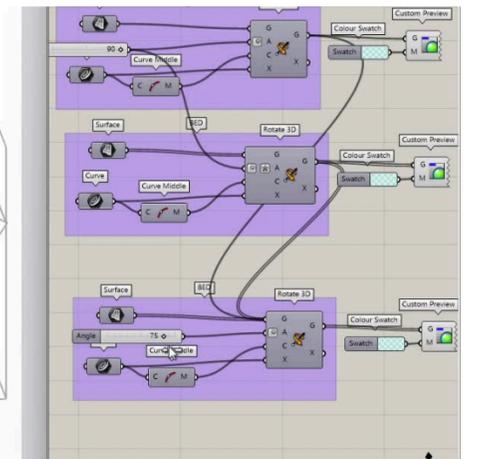

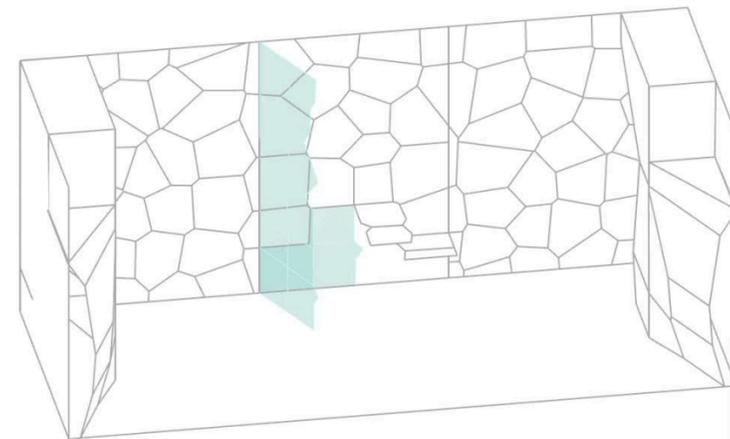

Folding in chair and table

Reconfiguring wall

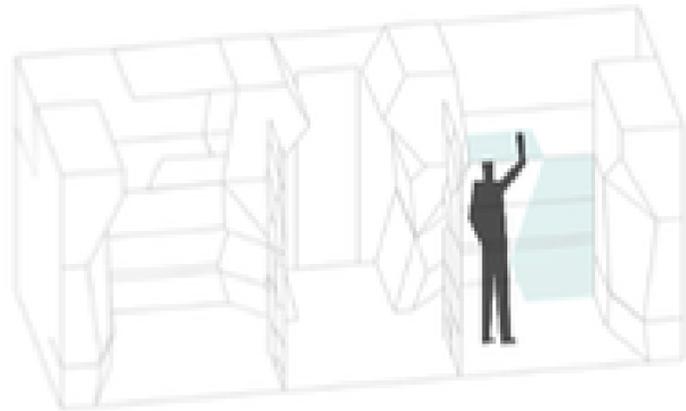

Relaxing

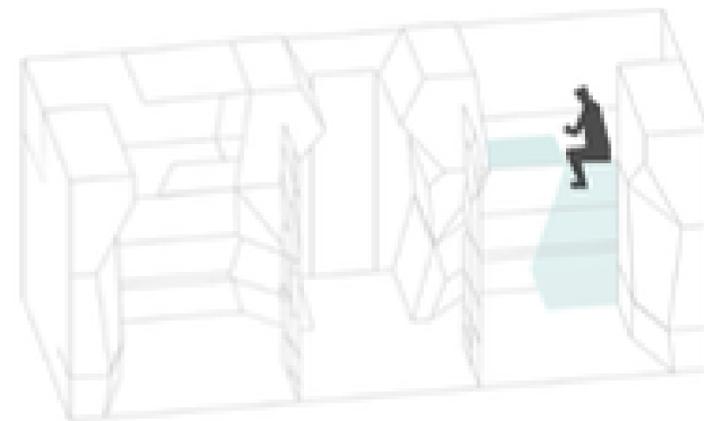

08 ADAPTIVE FURNISHING | 24H MAPPING

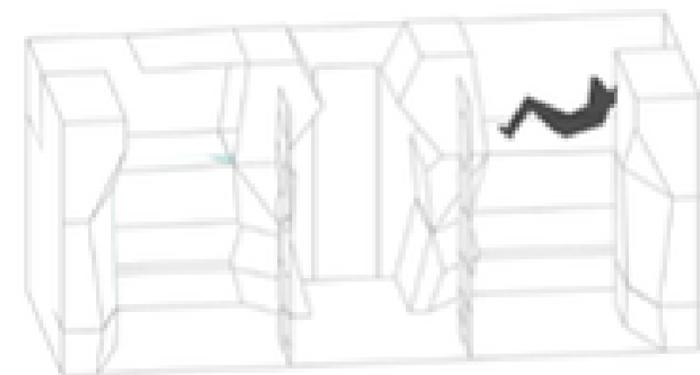

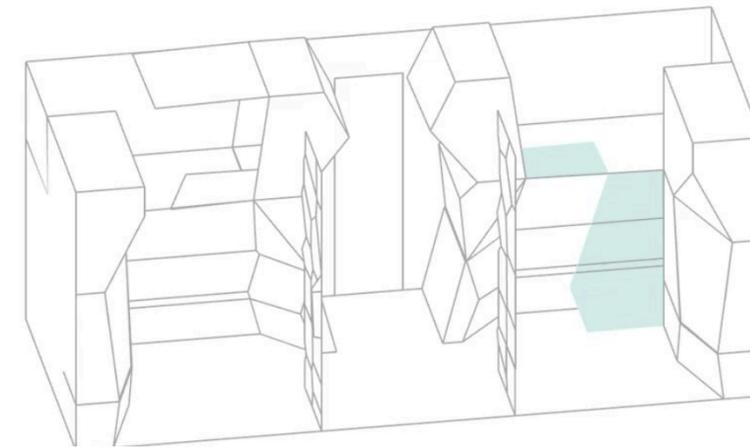

21.00-22.00: Relaxing & Sleeping - User 1

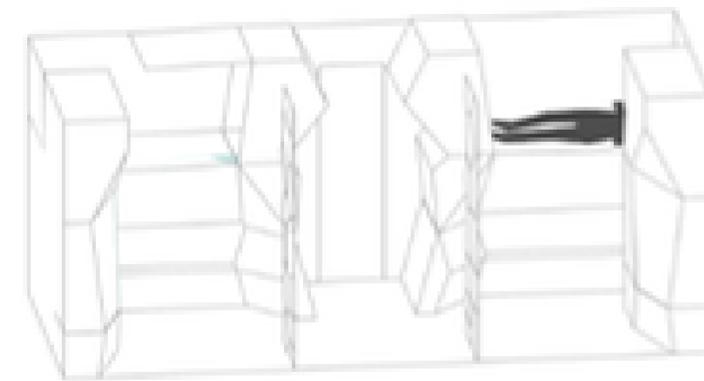

Folding out ladder and bed safety barrier

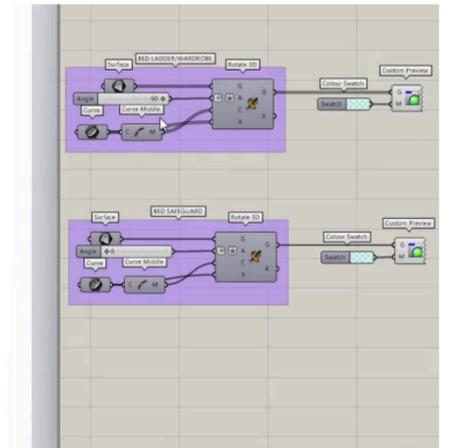

Climbing up the bed

In bed activities

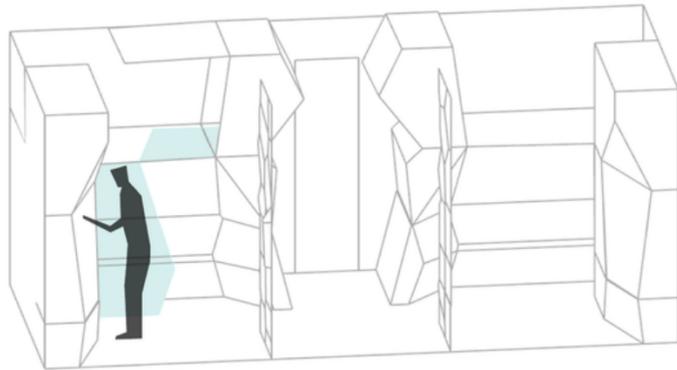

Sleeping

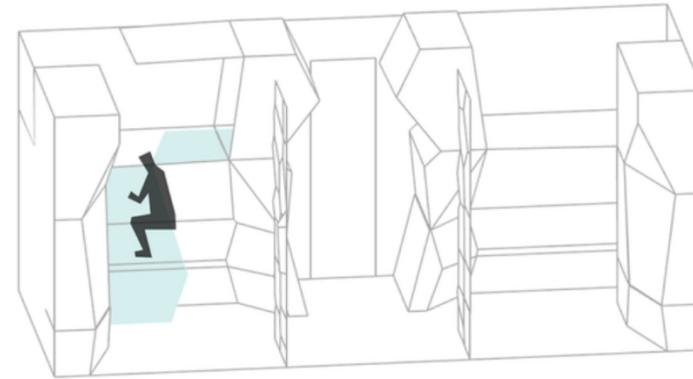

08 ADAPTIVE FURNISHING | 24H MAPPING

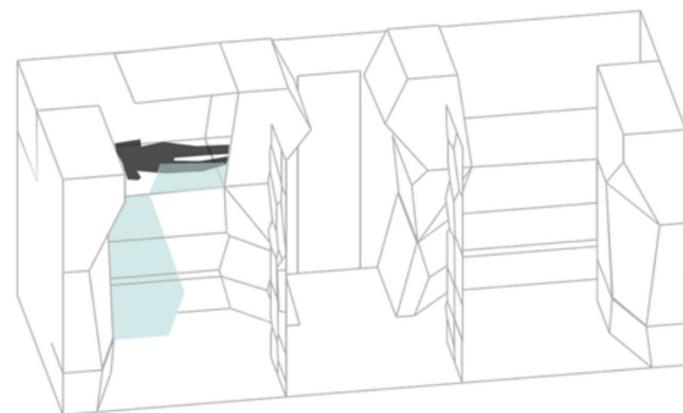

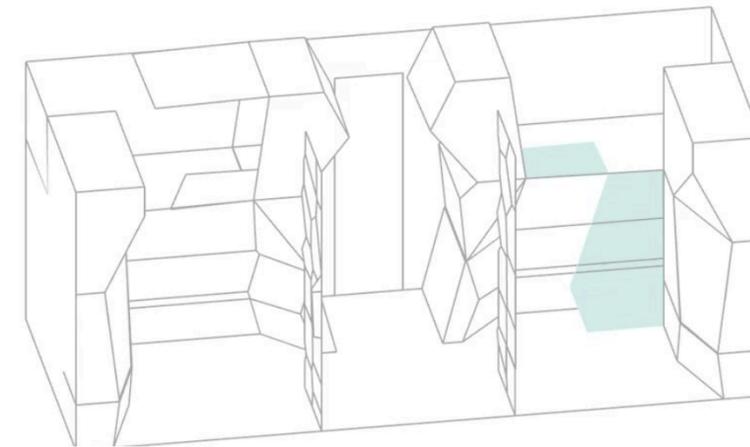

22.00-23.00: Sleeping - User 2

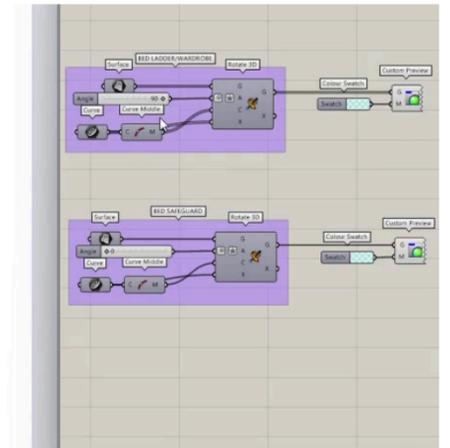

Folding out ladder and bed safety barrier

Climbing up the bed

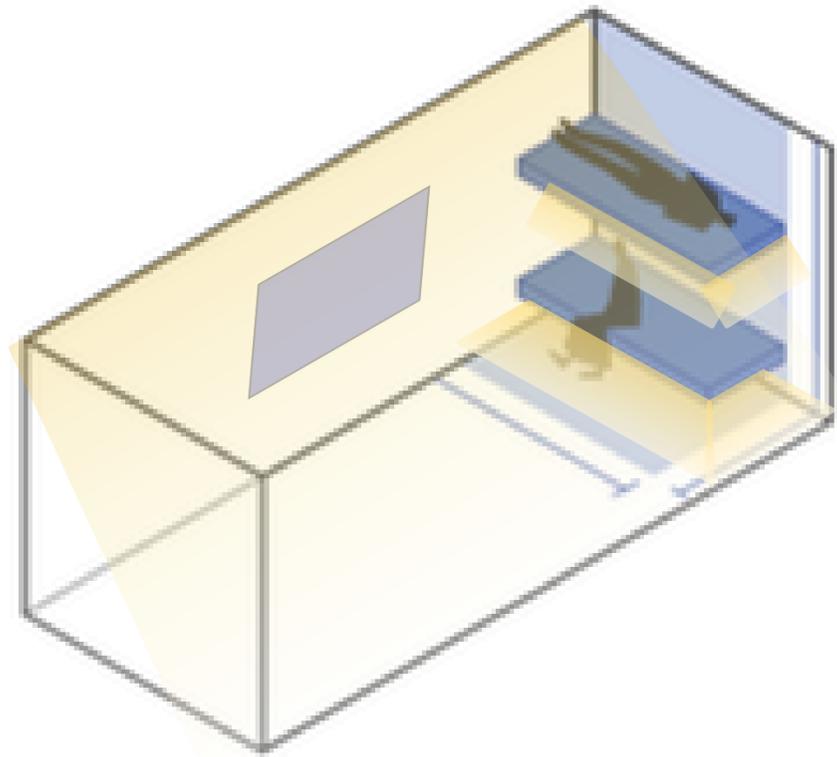

Sleeping

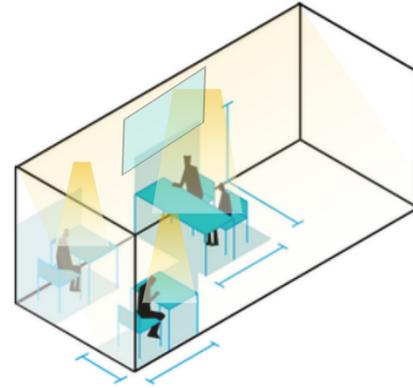

09 LIGHTING | NEEDS

Base lighting

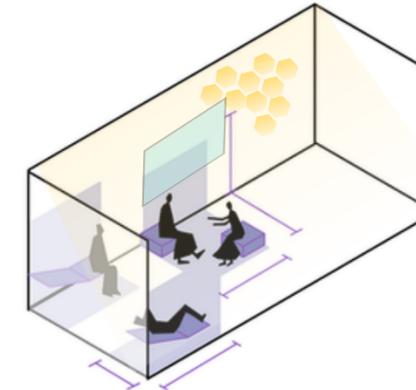

Primary

Task lighting

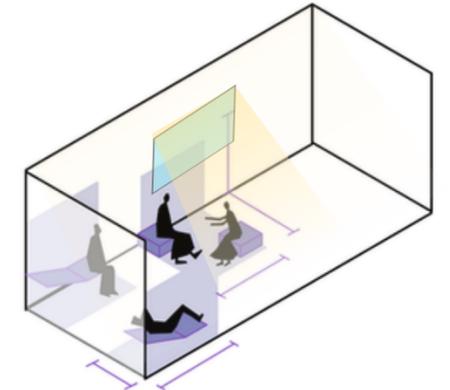

Secondary

Ambient lighting

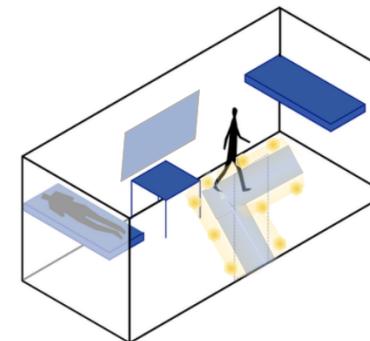

Secondary

Natural light

Secondary

Navigating lighting

Tertiary

10 LIGHTING | ARCTIC AND CIRCADIAN

- **Arctic winter:** the sun never rises above the horizon-> no direct sunlight, dim light 1-50lux and very cool blue twilight
- **Arctic summer:** the sun never sets, moves circular in the sky --> low angle warm light, 5-20,000 and 20.000-100.000 lux
- **Circadian cycle:** Bright daytime light, dark nights and regular 24h cycles

⇒ ⇒ **Problem:**

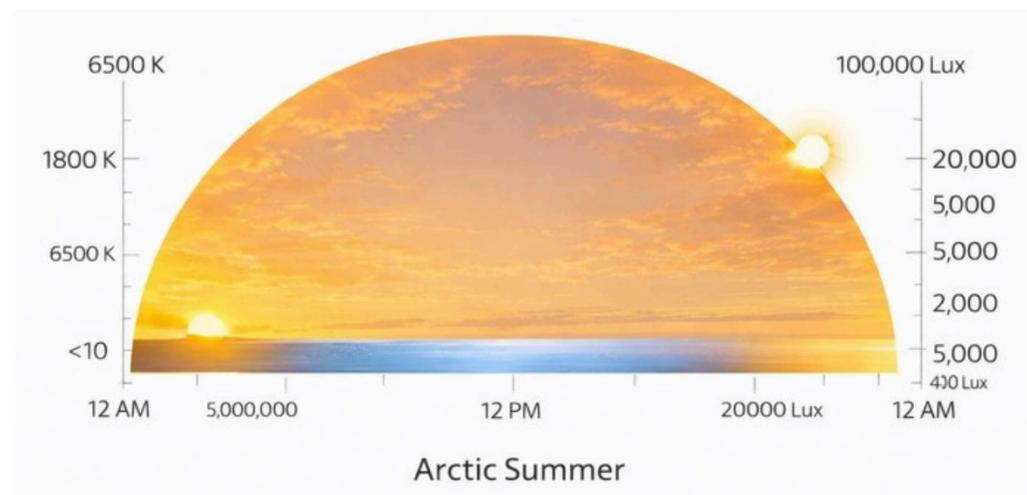

Arctic conditions provide either

- **Too much light** → **Summer**
- **Too little light** → **Winter**

⇒ ⇒ **Solution:**

Permanent Circadian sleep/wake light cycle

- artificially managed

Is there any way to use the Arctic light?

10 LIGHTING | ARCTIC AND CIRCADIAN

Windows are **not a reliable primary light source** in the Arctic environment
But provide **essential phycophysiological benefits**

Window eye level

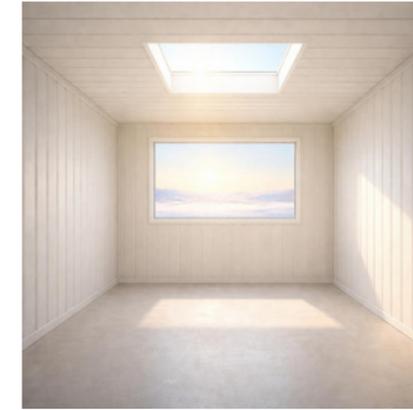

For **orientation**:

- seeing the outside → improves wellbeing through visual connection
- make the space 'feel' wider & less isolated
- **helps to stay connected to outside world**

Skylight window

For **light**:

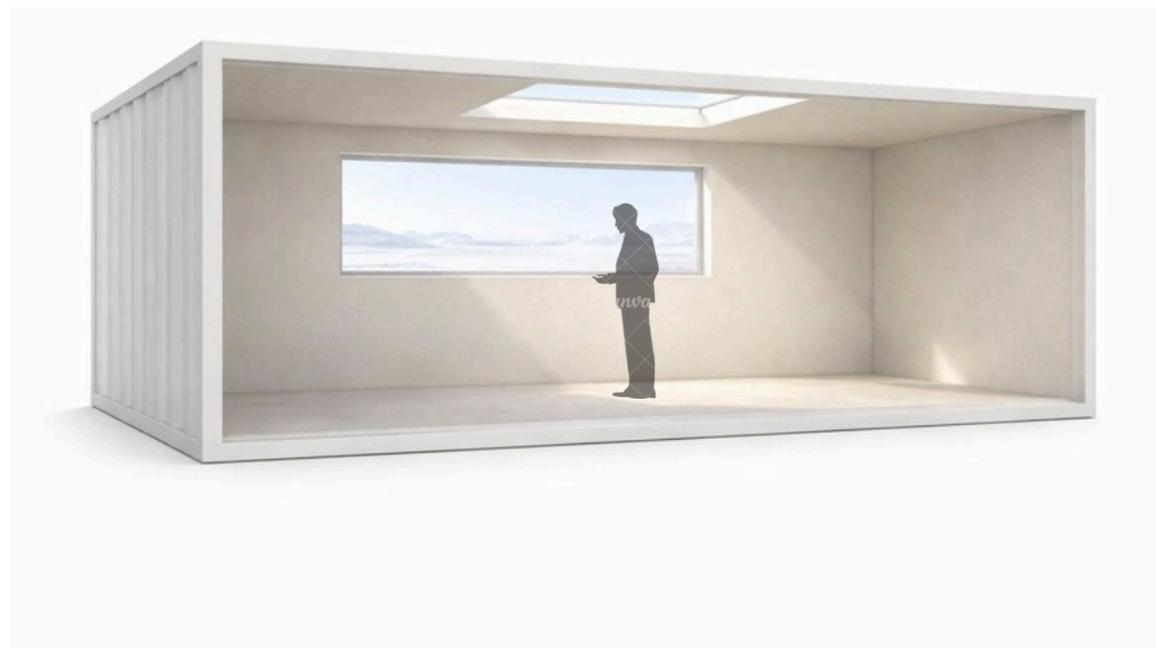

- gives a stronger 'feeling' of daylight
- help space feel less enclosed
- **works well together with artificial circadian lighting**

Arctic summer

Arctic winter

10

LIGHTING | ARCTIC AND CIRCADIAN

Windows can support the circadian light cycle inside the container but **must be controlled to support the system**

Arctic summer

There is too much light from the window

- Solar-control glass, filters brightness
- Diffusion, softens glare
- Shading, blocks excess light (lux-sensors)
- Artificial night, shading blocks all natural light
- **Artificial lighting dims to maintain circadian schedule inside with AI (lux- & CCT-sensors)**

Arctic winter

There is too little light from the window

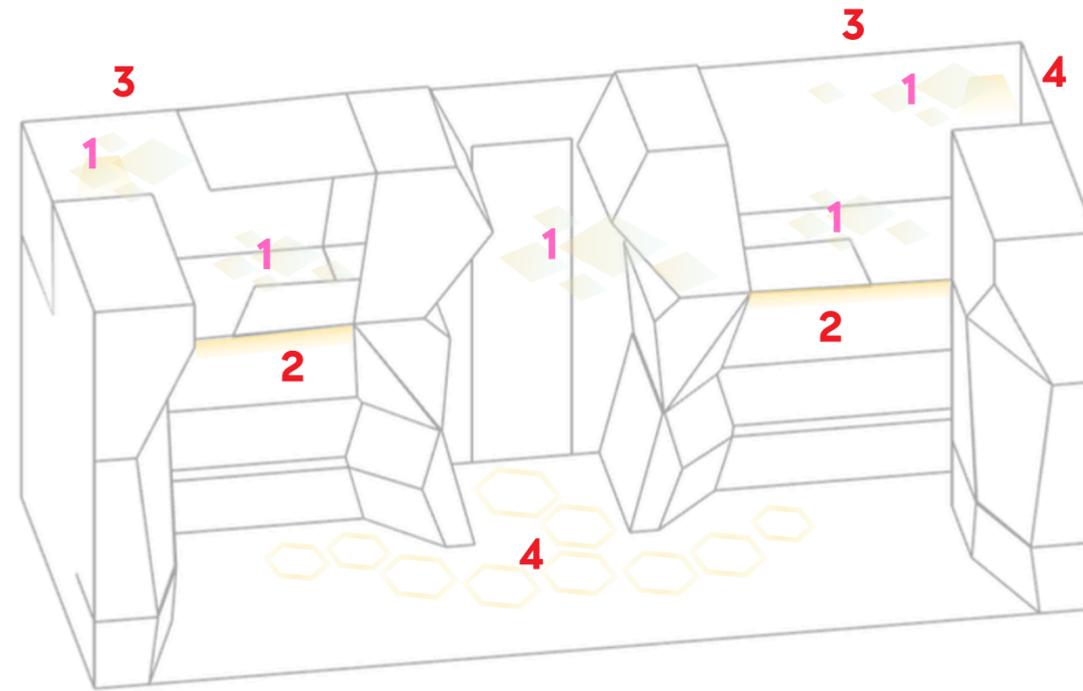

- Circadian daylight cycle as primary light provider
- is about perception an information not light
- **Artificial lighting adjusts color to maintain circadian schedule inside with AI (CCT-sensors)**

The AI system **dynamically adjusts intensity and CCT** in relation to outside to maintain the “controlled artificial day” despite changing external lighting conditions.

11

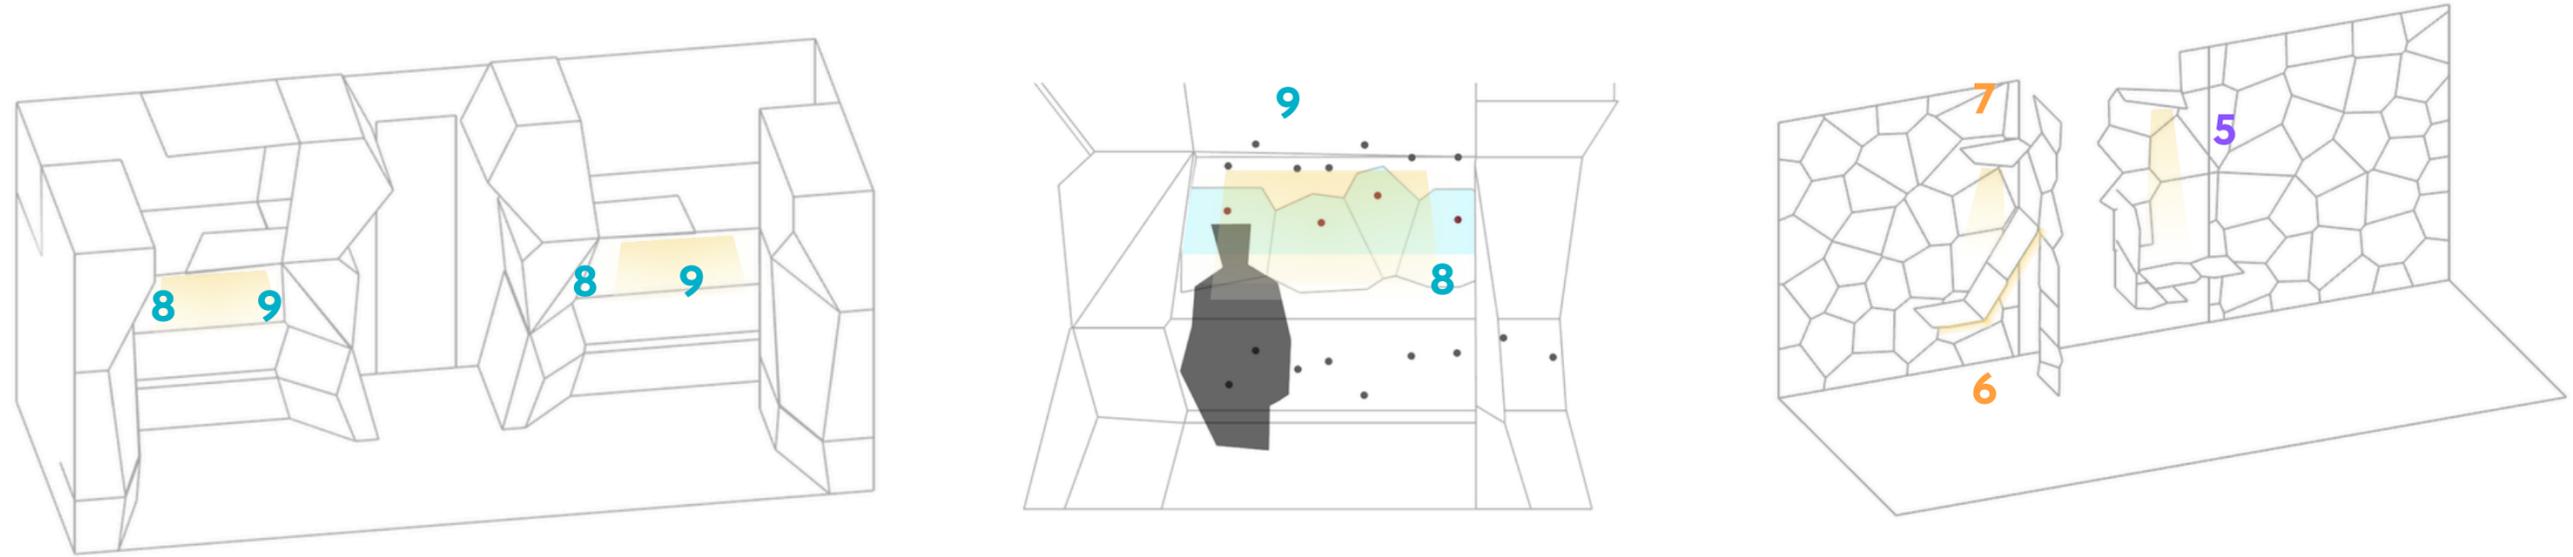

LIGHTING OVERVIEW

	What	Location	Type	Control settings	Control system on/off	Control system lux/CCT	AI feature
1	Sleep/ wake cycle day activities	voronoi cells on the ceiling, cells on wall	diffused	Collective	Automatic schedule & biometric sensors	Smartwatch/External sensors	
2	Sleeping In bed activities	Under the frame of the bed	diffused	Individual	Computer Vision/smartwatch	Smartwatch (alarm)	Turning off after no movement for x hours
3	Sleeping In bed activities	To the side of the head	direct	Individual	Smartwatch	Smartwatch	
4	Sleeping/ Emergency To navigate in darkness	on the floor/lower wall	glow	Collective	Computer vision	Computer vision	Responding in emergency situation

11

LIGHTING OVERVIEW

	What	Location	Type	Control settings	Control system on/off	Control system lux/CCT	AI feature
5	Dining	Above table	direct	Collective	Computer vision	Computer vision & smartwatch	
6	Relaxing	On wall cells/ under surfaces	diffused	Collective/individual	Computer vision	Smartwatch (ID)	bpm & blink rate
7	Relaxing	Above lounge chair	direct	Individual	Computer vision/Manual switch	Smartwatch (ID)	bpm & blink rate
8	Working	Above desk	direct	Individual	Computer vision	Smartwatch (Stress)	
9	Working	Integrated in window	diffused	Individual	Computer vision	Smartwatch (Stress)/External sensors	

12 LIGHTING | OPTIMAL LUX AND CCT

Primary

Activity / Moment	Purpose of Circadian Lighting	Illuminance (Lux)	CCT (Kelvin)
Wake-up / Morning	Gentle activation, start of daily rhythm	100–300 lux	2700–4000 K
Working	Increase alertness and maintain daytime rhythm	500–800 lux	5000–6500 K
Lounging	Maintain daily rhythm during lower-activity moments	100–200 lux	2700–3500 K
Dining	Maintain rhythm during shared meals	200–350 lux	3000–4000 K
In-bed activities	Prepare body for rest while keeping temporal cue	0–50 lux	1800–2700 K
Sleeping	Support sleep cycle, minimal biological stimulation	0–30 lux	1800–2200 K

heart_rate_bpm

Physical state	Range	Notes	Lighting changes
Calm/relaxed	60-80 bpm	Resting heart rate	Nothing
Stressed	85-110 bpm	Higher than normal	reduce intensity, warmer light (+/- 3000 K)
Tired	50-65 bpm		If person needs to stay awake -> cooler color temperature (5000–6500 K) and 500–1000 lux

pupil_mm

Physical state	Range	Notes	Lighting changes
Calm/relaxed	2-4 mm ('normal' lighting)	Pupil is smaller than stress state	Nothing
Stressed	4-6 mm		reduce intensity, warmer light (+/- 3000 K)
Tired	2-3 mm	Smaller but unstable	If person needs to stay awake -> cooler color temperature (5000–6500 K) and 500–1000 lux

blink_rate_per_min

Physical state	Range	Notes	Lighting changes
Calm/relaxed	10-20 blinks/min	Natural blinking	Nothing
Stressed	20-35 blinks/min		reduce intensity, warmer light (+/- 3000 K)
Tired	20-40 blinks/min	Longer blinks, eyelid closure increases	If person needs to stay awake -> cooler color temperature (5000–6500 K) and 500–1000 lux

Secondary

Activity / Moment	Lighting Layer	Purpose	Illuminance (Lux)	CCT (Kelvin)
Working	Task lighting	Focus, detailed work	750–1000 lux	5000–6500 K
Lounging	Ambient lighting	Relaxed atmosphere	150–250 lux	2500–3000 K
Lounging / Reading	Task lighting	Reading support	150–300 lux	2700–3500 K
Dining	Ambient lighting	Warm social atmosphere	150–300 lux	2700–3500 K
In-bed activities	Ambient lighting	Calm background light	5–50 lux	2200–2700 K
In-bed activities	Task lighting	Reading / specific in-bed activity	150–300 lux	2700–3500 K
Night movement	Navigation lighting	Safe movement without disturbance	1–10 lux	1800–2200 K

13 LIGHTING AND AI | CONTROL SYSTEMS

Strategy

Minimise n of different control systems, detection errors and maintenance requirements

3 systems

- **Computer Vision (CV)** → Acts as the 'eyes'.
- **Smartwatch** → Provides the 'biological data'.
- **Manual Overrides** → Users can always take control via manual sliders

Hierarchy:

individual preferences and adaptation
environmental context

to do that: questionnaire and safeguard limits

Health Safeguards

- Red Warning: Shown when manual settings are outside healthy ranges.
- Corrective Fade: A gradual 30-minute transition back to healthy light levels.

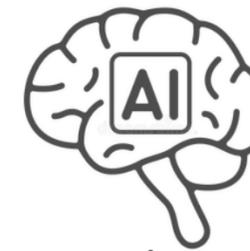

Dual Control Logic

We distinguish between Trigger Control (turning lights on/off) and Atmospheric Control (adjusting CCT and Lux).

COMPUTER VISION

AI SYSTEM

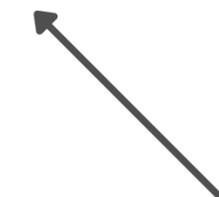

SMARTWATCH

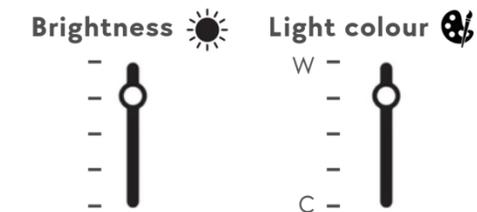

CCT/LUX ON/OFF

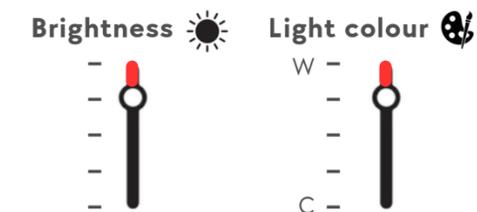

LIGHTS

MANUAL OVERRIDERS

Sliders for manual control

Sliders for manual control for values outside of safeguard limits

Conclusion

Manual Overrides = Priority 1 User Comfort.

Atmospheric Control = Priority 2 Health & Safety

15 LIGHTING AND AI | CONTROL SYSTEMS

Layer 1: Identity

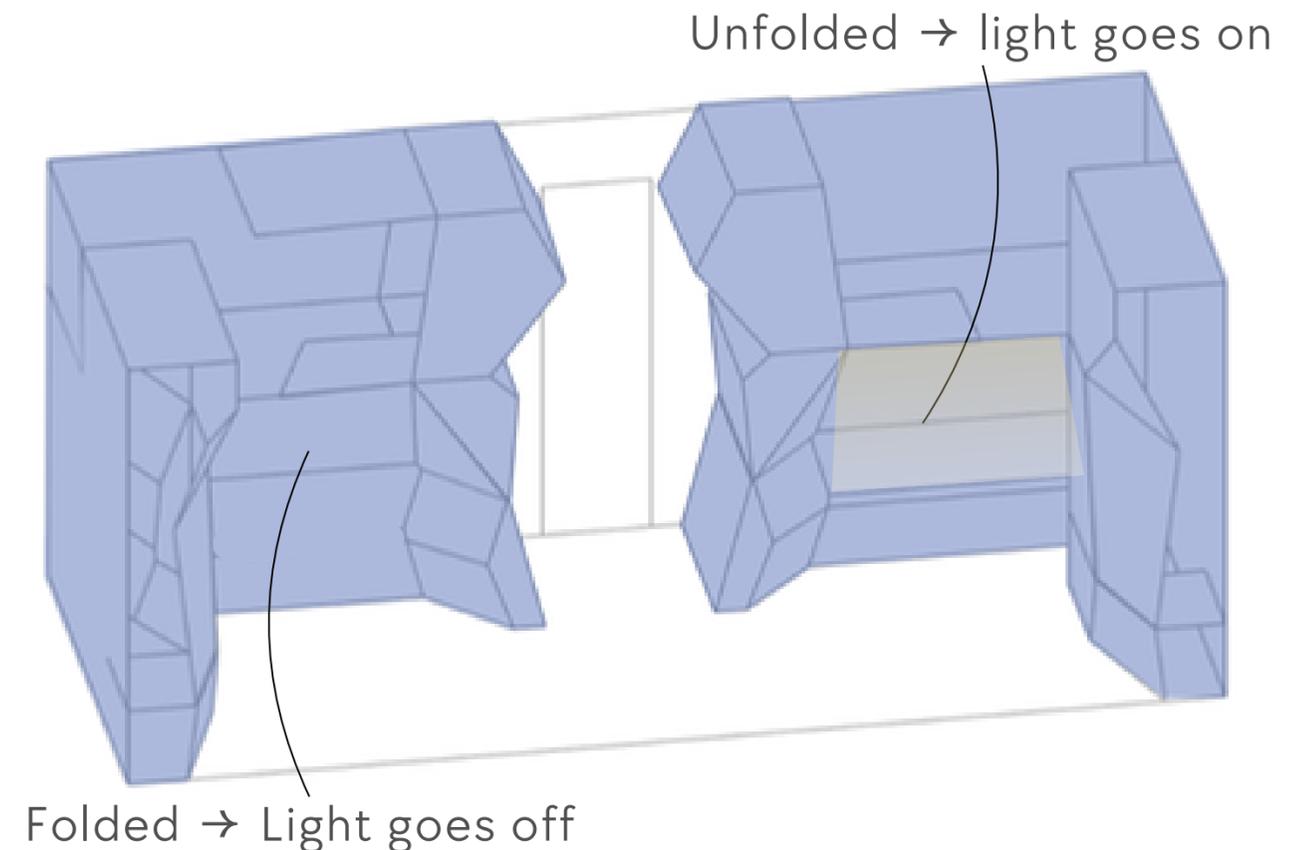

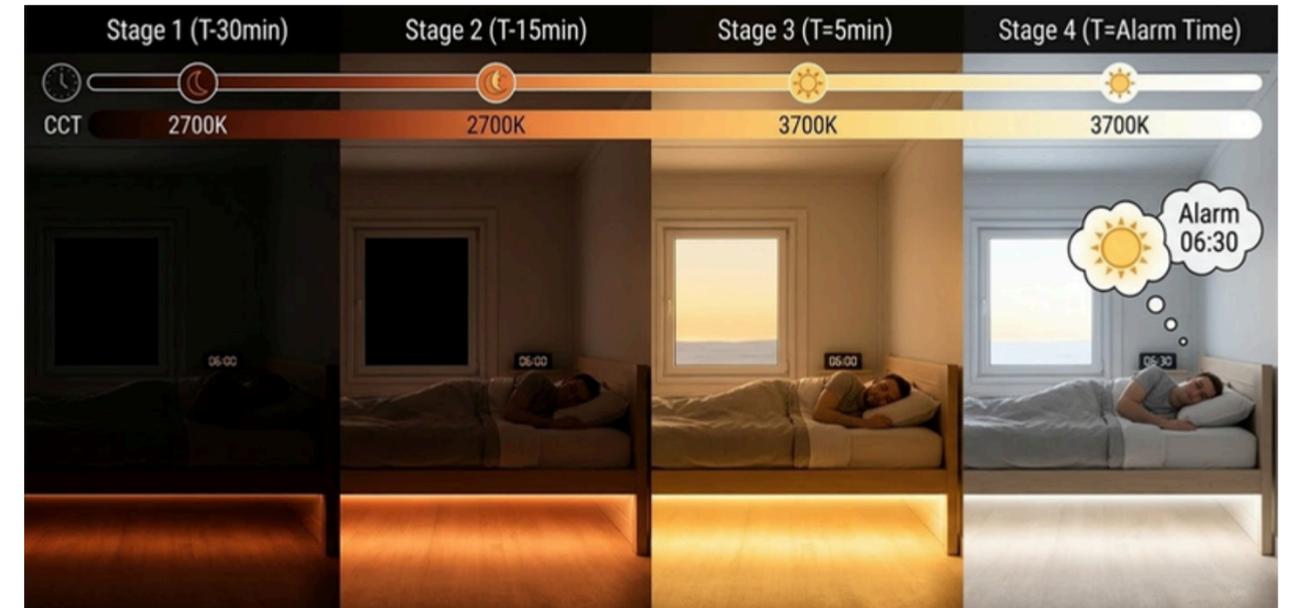

- Key: smartwatch (who is in the room?)
- Personal preferences: CCT & Lux
- Circadian: sunrise simulation (30 min)

Layer 2: Activity

- Eyes: computer vision
- Intent: Detects when the desk is unfold to activate a 'Work' scene
- Stress-relief lighting (heart rate)

Layer 3: Context

- Exterior sync: actic weather data
- Polar night: increases the light quality to mimic sunlight (High CRI)
- Midnight sun: digital darkness (melatonin support)

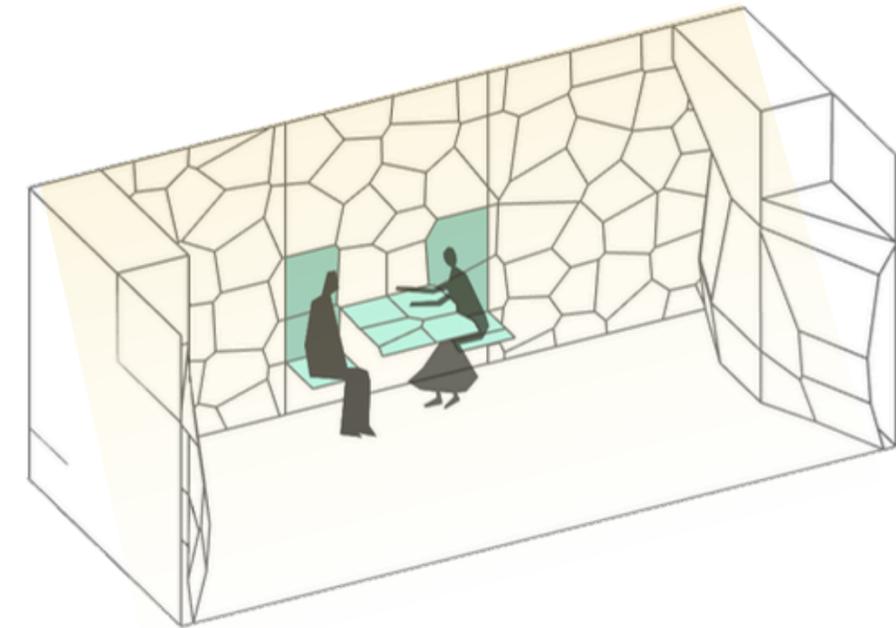

16 LIGHTING AND AI | AMBIENT LIGHTING

Two Modes: Vision-Driven Logic

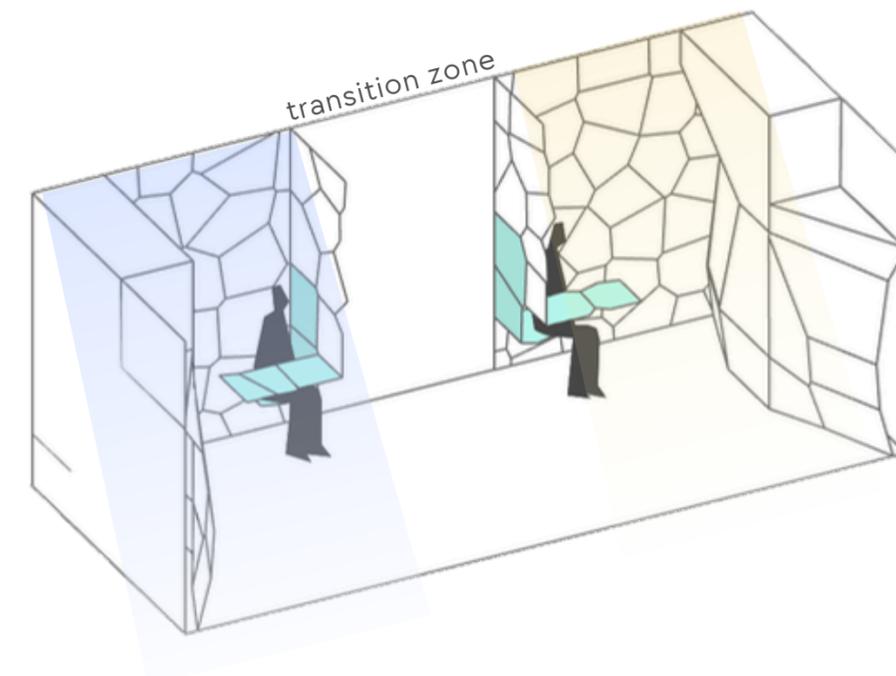

Computer Vision recognizes the furniture configuration to trigger the correct mode automatically.

- **Collective Mode** (Table Centered):
 - Trigger: Table in the center (detected by CV).
 - Collective Balancing. The AI calculates an average between both users.
 - All lighting zones are synced to for example a warm 3000K setting for shared activities.
- **Private Mode** (Table Rotated or Split):
 - Trigger: Table split or rotated.
 - The AI divides the container into two personalized "light bubbles."
 - These bubbles follow the residents through the space using UWB (Apple Watch) tracking.

Collective mode

Private mode

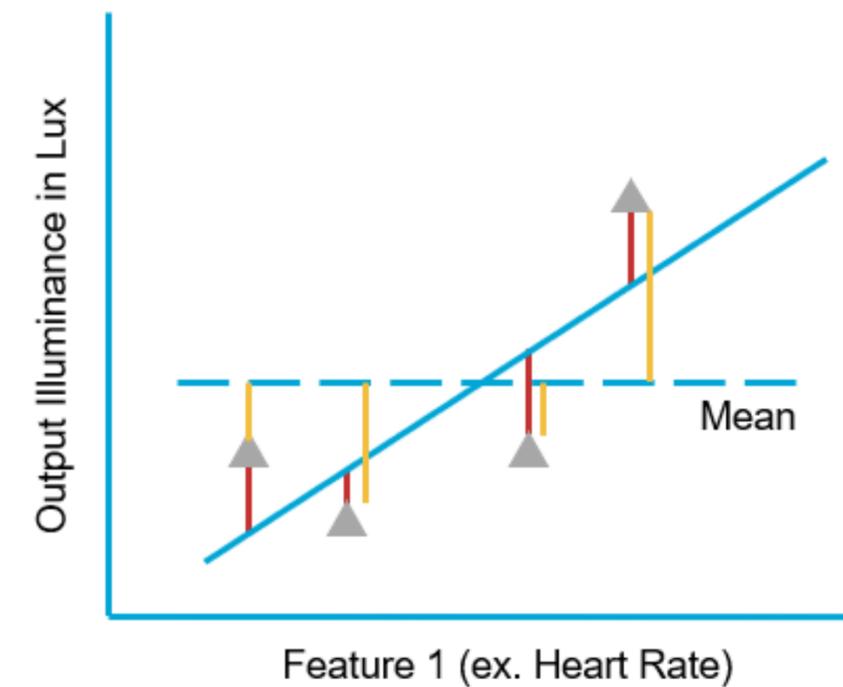

17 MACHINE LEARNING | INTRODUCTION

TUTORIAL 27/02/26 OF JUPITER NOTEBOOK

The values the Jupiter Notebook model produces is the prediction of what the lux should be according to the model. This model uses the technique of neural networks.

Machine learning, unlike AI, infers patterns from data while AI needs the patterns as an input.

To implement the control systems we used machine learning to control and predict the lighting systems, this was done by a Jupyter Notebook code with neural networks.

18 MACHINE LEARNING | PRE-TRAINING

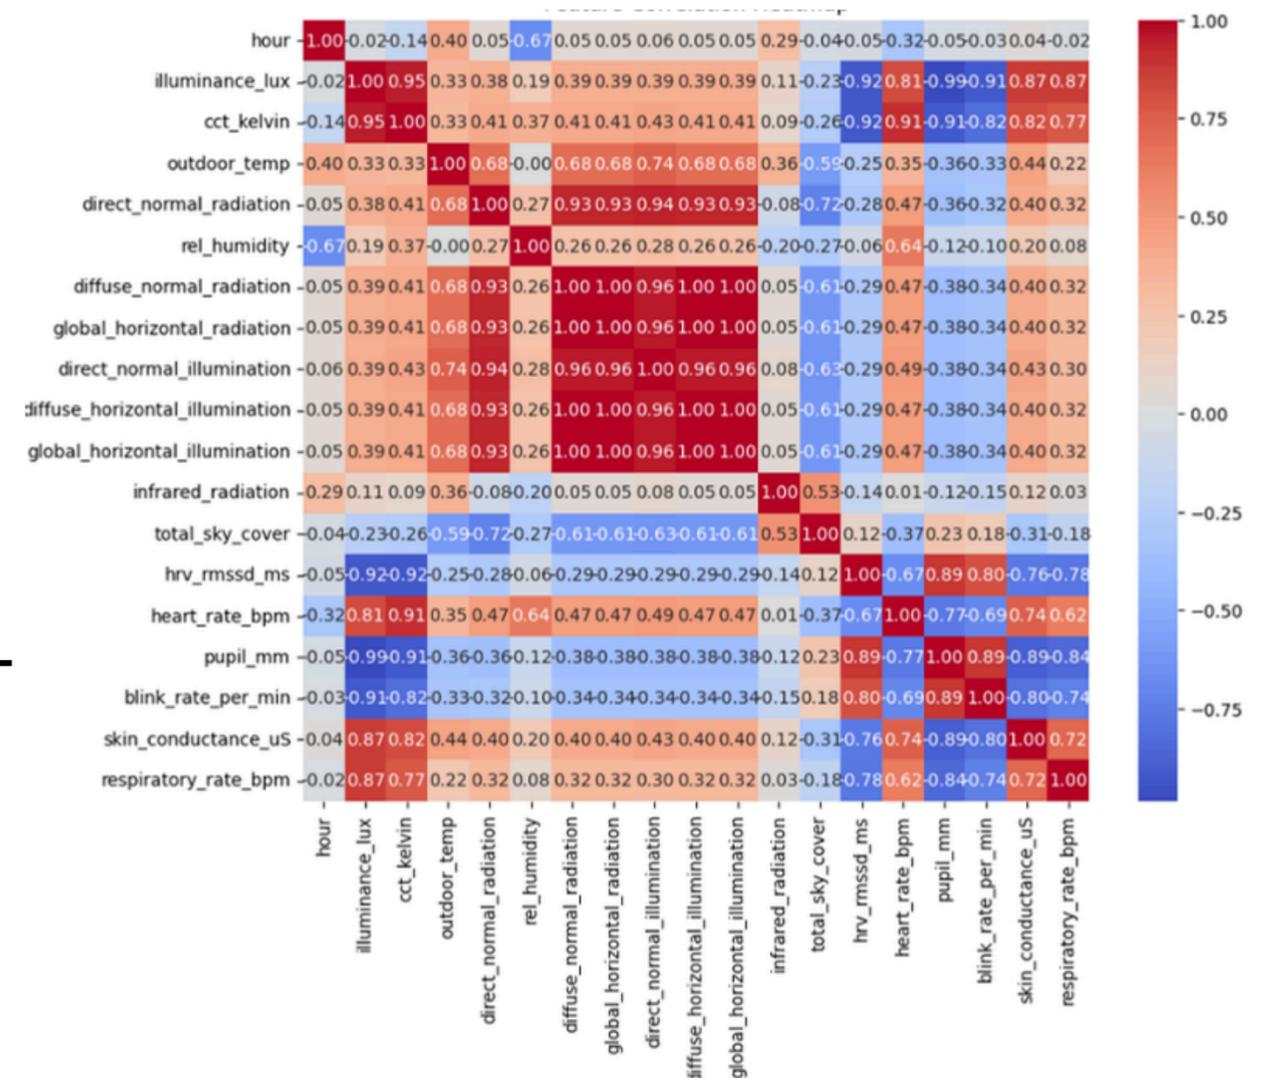

SUPERVISED LEARNING

- Features are the input variables, possible features;
 - **Weather features;** outdoor_temp, direct_normal_radiation, rel_humidity, diffuse_normal_radiation, global_horizontal_radiation, infrared_radiation, direct_normal_illumination, diffuse_horizontal_illumination, global_horizontal_illumination, total_sky_cover.
 - **Physiological features;** hrv_rmssd_ms, heart_rate_bpm, pupil_mm, blink_rate_per_min, skin_conductance_uS, respiratory_rate_bpm.
- Labels are the output values, in this case the predicted illuminance_lux and cct_kelvin

SELECTING THE FEATURES AND LABELS: BALANCING ACCURACY OF MODEL WITH RISK OF OVERFITTING

- Choosing and grouping features.
 - Features with high correlation >0.8 with each other may be redundant, so they can be grouped or dropped.
 - Features with high correlation with labels are likely strong predictors.
- With cross-validation we are testing the overfitting, if results are similar to the test score, that means low overfitting.

Feature correlation heatmap

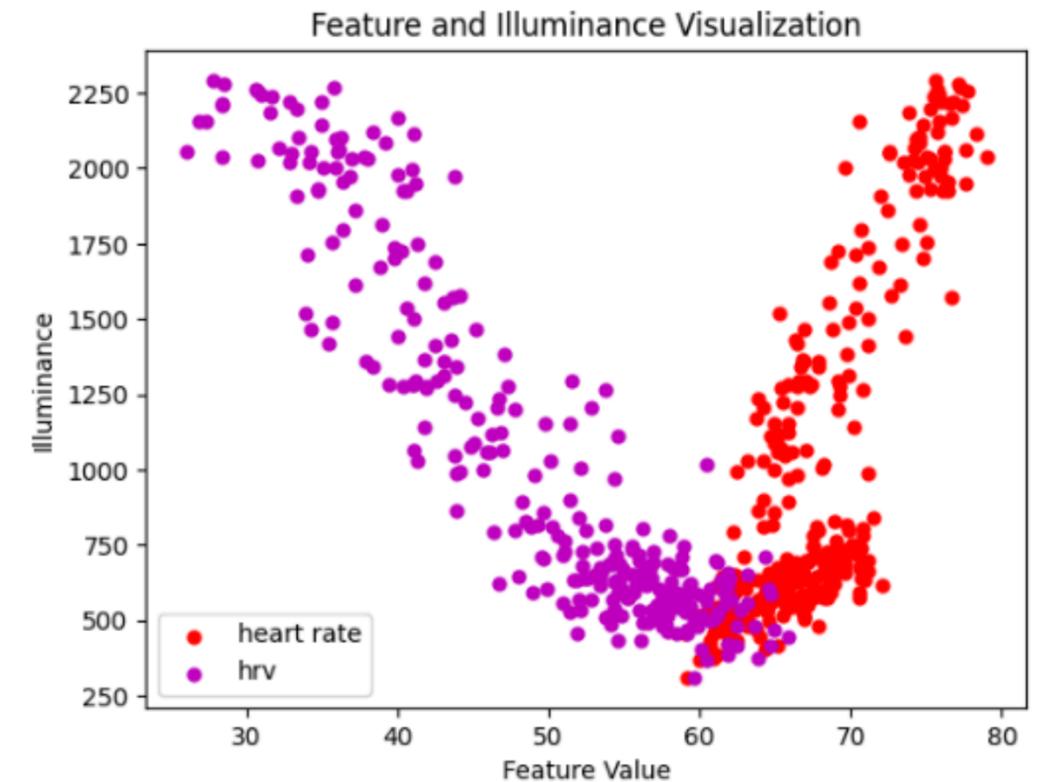

19 MACHINE LEARNING | TRAINING

FEATURE GROUPING

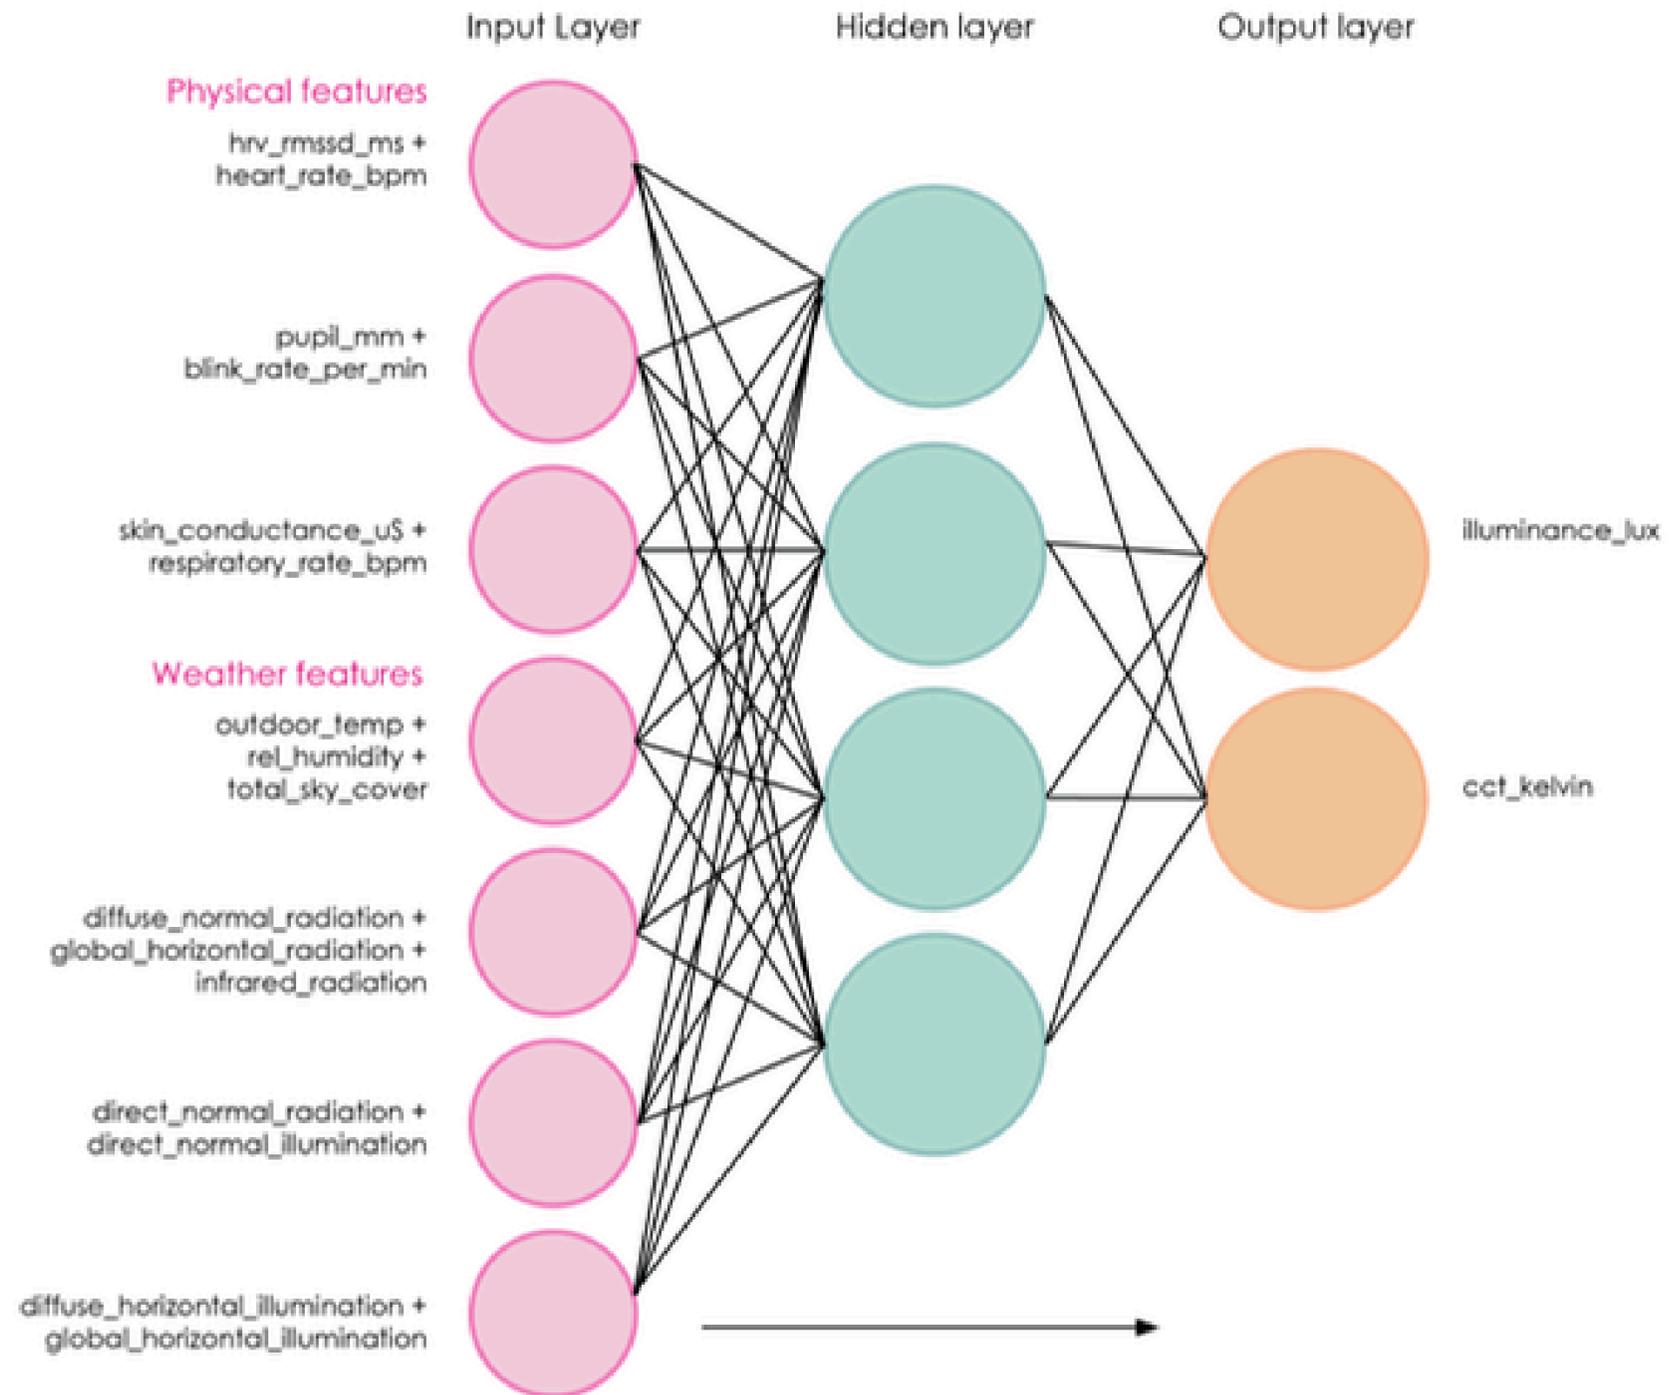

- For the weather features e.g. I found strong correlations, which can be grouped together to reduce redundancy: Direct radiation and direct illumination (0.94) and diffuse horizontal and global horizontal illumination (0.88)
- For the physiological features e.g. I found inversely correlated features, one of these can be used as a representative feature. HRV and heart rate (0.85).

EVALUATING MODEL PERFORMANCE

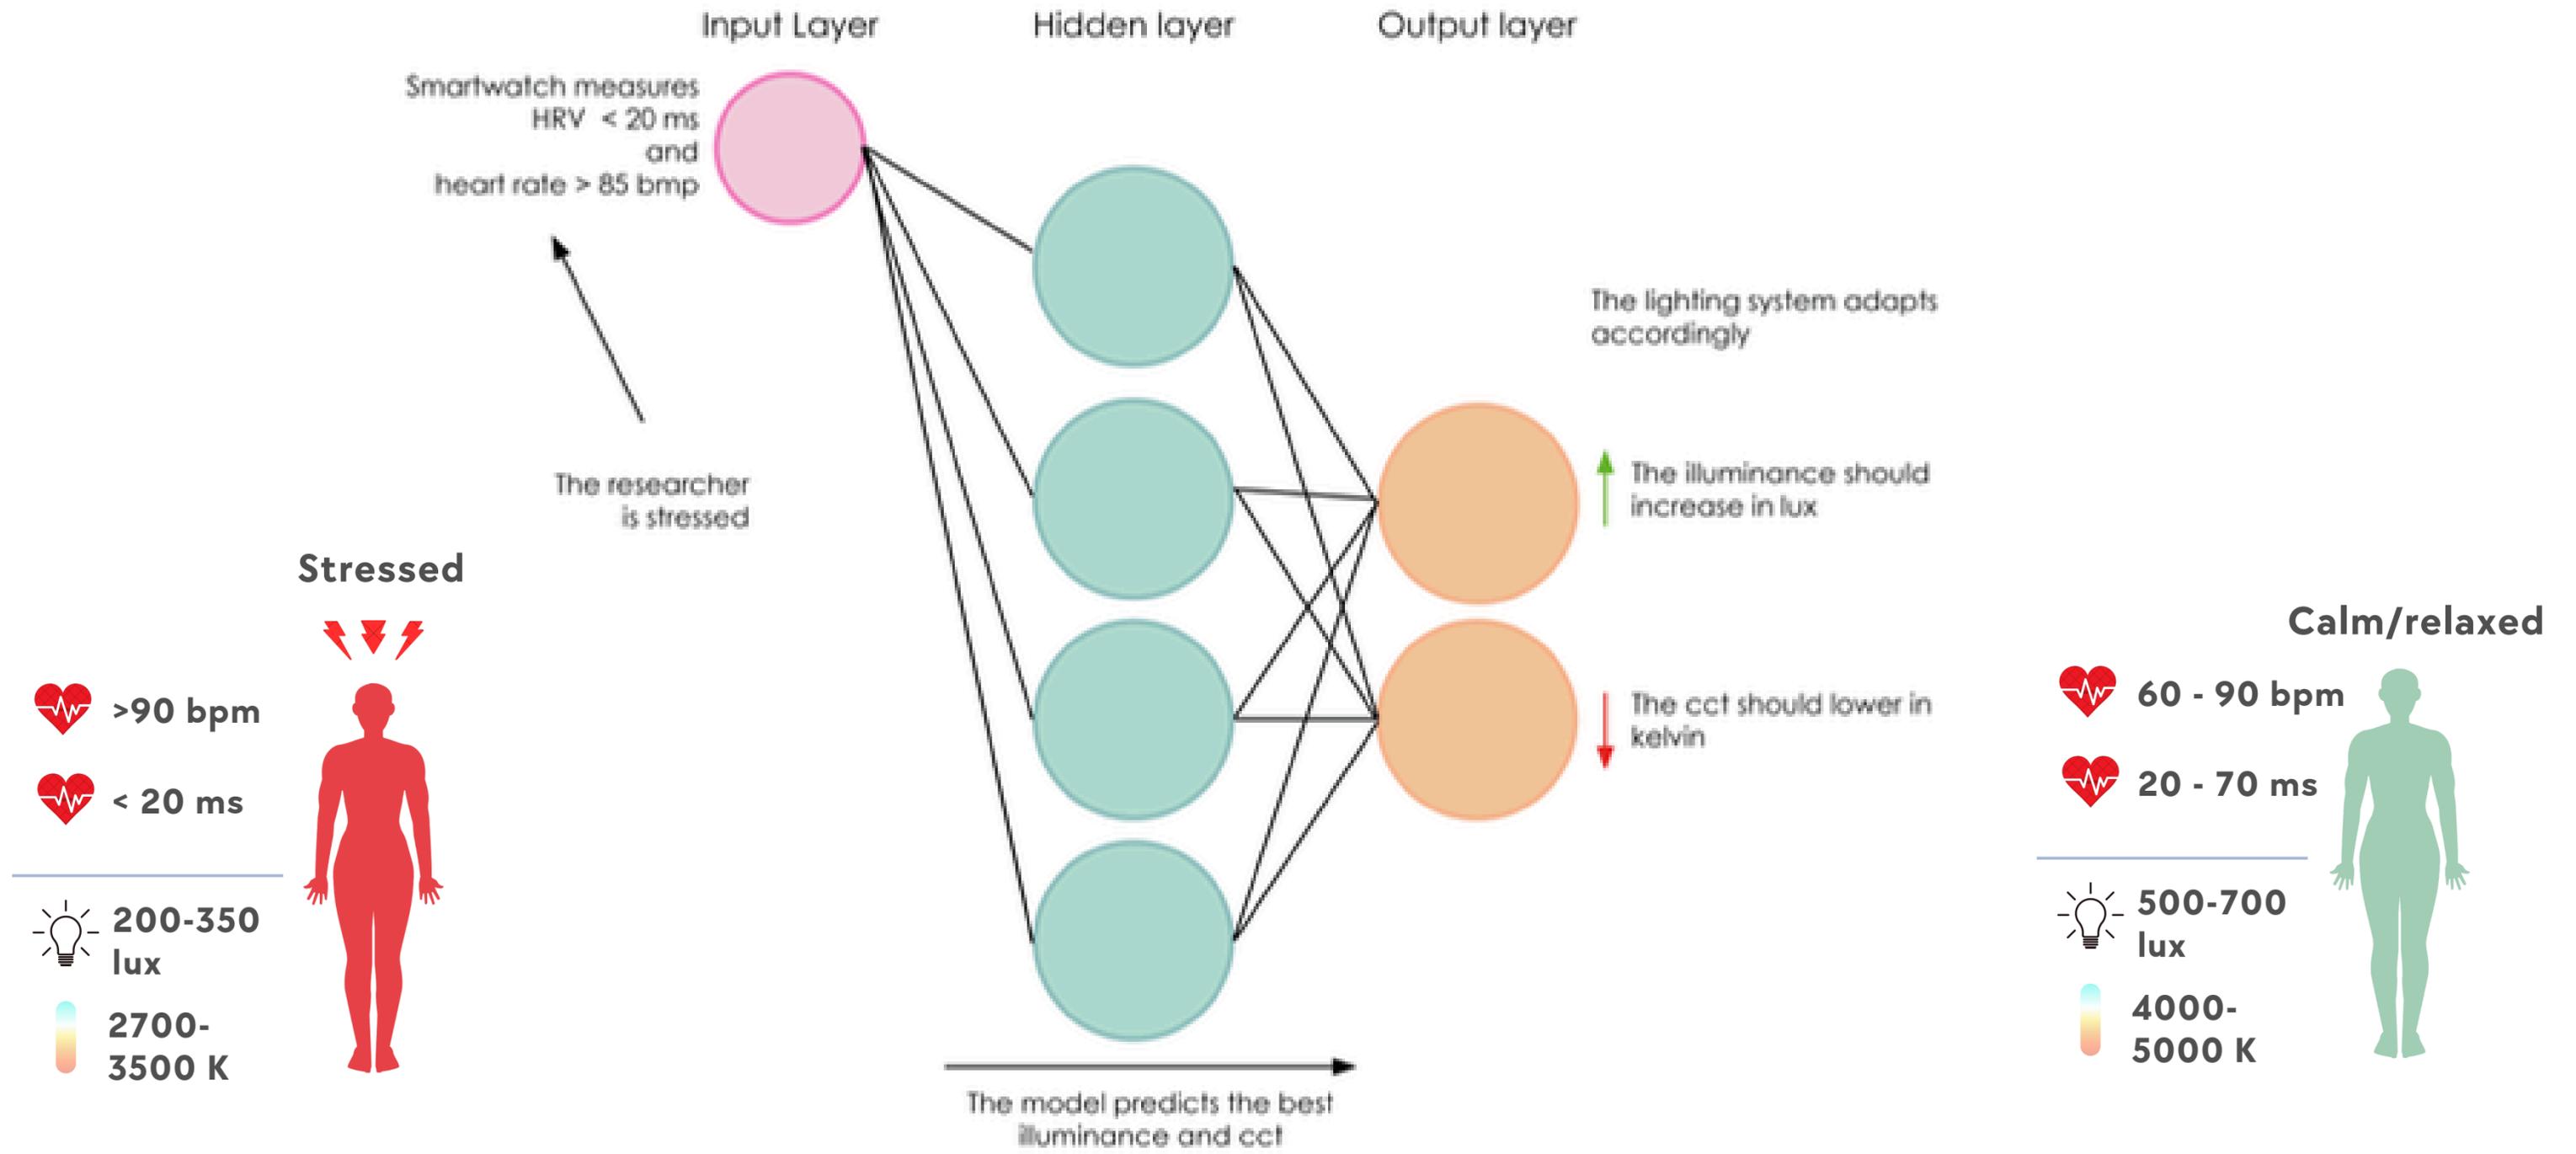

- **R-square** is used to evaluate how well the model represents the data (the variance of the mean). For example, if R-square is 80%, then the model can express 80% of the variability.
- Error functions such as **RMSE** and **MAE** provide information about how far off the estimation is from the actual value. RMSE penalizes large errors and MAE takes the average. Both of the scores are relative to the scale of the dataset.
- Performance of the first model vs second model trained with adjusted features;
- R-square = 0.13752631245104485 → 0.6972536094819399,
- RMSE = 547.2232257652937 → 401.7306132398937,
- MAE = 463.33269614523095 → 322.292021438062
- Conclusion; clear improvement of the model performance.

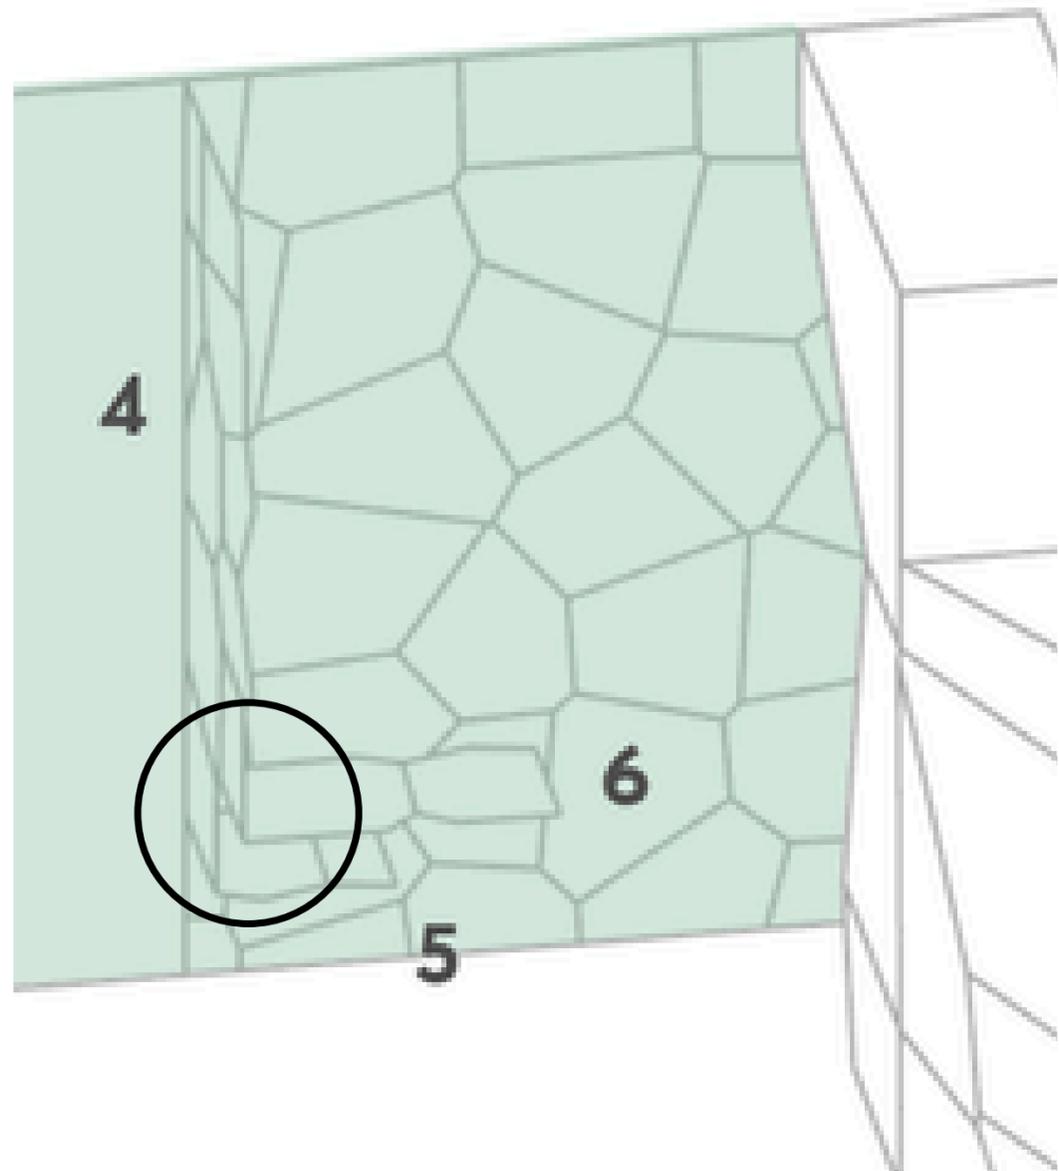

20 MACHINE LEARNING | TRAINING - FEATURE GROUPS

MACHINE LEARNING | TRAINING - EXAMPLE

23 CHOOSEN FRAGMENT

A piece of the kinetic wall:

Lounge chair/Dining chair

Thank you for your attention !
